

Generalized Whitehead Products and Homotopy Groups of Spheres

By HIROSI TODA

(Received September 15, 1952)

Introduction

A fundamental problem in algebraic topology, the calculation of homotopy groups $\pi_r(S^n)$ of spheres, was initiated by studies of several authors; Brouwer's degree, Hopf's invariant and Freudenthal's suspension method. Recently, G. W. Whitehead [22] [23]¹⁾ generalized Hopf's invariant and Freudenthal's invariant to enumerate several non-trivial homotopy groups of spheres. It is reported that H. Cartan, P. Serre, G. W. Whitehead, and W. S. Massey²⁾ have obtained a number of remarkable results²⁾, applying Eilenberg-MacLane's cohomology theory of a group complex.

Methods employed here by author, are rather intuitive. Making use of recent results due to S. Eilenberg and S. MacLane [7], he constructs an elementary CW-complex K_n , the n -section K_n^n of which is an n -sphere S^n , such that excepting $\pi_n(K_n) = \mathbb{Z}$, all the other homotopy groups vanish. Generators in $\pi_r(S^n)$, which are essential in the $(n+k-1)$ -skeleton K_n^{n+k-1} and inessential in K_n^{n+k} , can be represented by the image of the boundary homomorphism: $\pi_{r+1}(K_n^{n+k}, K_n^{n+k-1}) \rightarrow \pi_r(K_n^{n+k-1})$. Thus, generators of $\pi_r(S^n)$ can be realized by adequately chosen maps in virtue of the construction of the complex K_n . Main results in this paper are stated as follows.

Theorem i) $\pi_{n+3}(S^n) = \mathbb{Z}_{24}$ for $n \geq 5$, the generator of which is represented by $(n-4)$ -fold suspension of the Hopf's fibre map: $S^7 \rightarrow S^4$.

- ii) $\pi_{n+4}(S^n) = 0$ for $n \geq 6$,
- iii) $\pi_{n+5}(S^n) = 0$ for $n \geq 7$,
- iv) $\pi_{n+6}(S^n) = \mathbb{Z}_2$ or $\mathbb{Z}_2 + \mathbb{Z}_2$ for $n \geq 8$,
- v) $\pi_{n+7}(S^n)$ is the direct sum of \mathbb{Z}_{15} and a group of order $2^k (3 \leq k \leq 8)$ for $n \geq 9$.
- vi) $\pi_{n+8}(S^n)$ is a group of order 2^k for $n \geq 10$.

In Chapter 1 various kinds of notations are given and the excision theorem³⁾ due to A. L. Blakers and W. S. Massey is stated in order to be available under the removal of the restriction in dimensions. In Chapter 2 Whitehead product

1) Numbers in brackets refer to the references cited at the end of the paper.

3) Theorem I of [3].

is generalized to get certain types of products, called generalized Whitehead product⁴⁾, which have much to do with the Hopf construction of G. W. Whitehead. In Chapter 3 generalized Hopf invariant and Freudenthal invariant are systematically discussed as a Hopf homomorphism of a triad $\pi_n(S^r; E_+^r, E_-^r)$. Generalizing this homomorphism to define a Hopf homomorphism of $\pi_n(X^*; \mathcal{E}^r, X)$, we obtain that $\pi_n(X^*; \mathcal{E}^r, X)$ has a direct factor isomorphic to $\pi_{n-r+1}(X, \mathcal{E}^r) \otimes \pi_r(\mathcal{E}^r, \mathcal{E}^r)$ in lower dimensional cases. In Chapter 4, essential elements in homotopy groups $\pi_n(S^r)$ of spheres of special dimensions, are given and also their essentiality is shown by means of Hopf invariant. In Chapter 5, a homomorphism $T: {}_2[\pi_n(X)] \rightarrow \pi_{n+1}(X)/2\pi_{n+1}(X)$ is introduced in order to consider the element of order four in $\pi_{n+3}(S^n) (n \geq 3)$, which Barratt and Paecher obtained recently. In Chapter 6 it is shown how the suspension homomorphism of Eilenberg-MacLane⁵⁾ is interpreted as homomorphisms of homology groups of K_n, K_{n+1} by making use of their recent results. Chapter 7-8 involve our principal results. Making use of preparations in the previous chapters, we can compute automatically homotopy groups $\pi_n(S^r)$ of spheres. We calculate homotopy groups of the n -fold suspended space Y^{n+1} of the projective plane, making use of T -homomorphism in Chapter 5.

Chapter 1. Preliminaries

i) In this section, we shall describe several notations, which will be used throughout this paper.

Symbols $(X; X_1, \dots, X_n, X_0), (X; X_1, \dots, X_n), (X, A, x_0), (X, A)$ and (X, x_0) indicate systems of topological spaces such that $X \supset X_i, X_1 \cap \dots \cap X_n \ni x_0, X \supset A \ni x_0$ and $X \ni x_0$. A mapping $f: X \rightarrow X'$ is a continuous function of X to X' , and if $f(X_i) \supset X'_i$ and $f(x_0) = x'_0$, the mapping f is indicated by $f: (X; X_1, \dots, X_n, x_0) \rightarrow (X'; X'_1, \dots, X'_n, x'_0)$. A homotopy $f_t^{(6)}: (X; X_1, \dots, X_n, x_0) \rightarrow (X'; X'_1, \dots, X'_n, x'_0)$ means that the homotopy $f_t: X \rightarrow X'$ carries the subsets X_i and x_0 to X'_i and x'_0 respectively. If $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are mappings, a composite map $g \circ f: X \rightarrow Z$ is given by $(g \circ f)(x) = g(f(x))$ for $x \in X$.

$x = (x_1, \dots, x_n)$ indicates a point of the real Cartesian space C of infinite dimension having the i -th coordinate x_n for $i \leq n$ and 0 for $i > n$, thus (x_1, \dots, x_n) and $(x_1, \dots, x_n, 0, \dots, 0)$ indicate the same point of C .⁷⁾ Define subspaces of C by

4) Products of this sort are also provided by A. L. Blakers and W. S. Massey; cf. Bull. Amer. Math. Soc. U.S.A. 57 (1951) abstract 165.

5) Cf. [7].

6) The homotopy is indicated by symbol: $f_0 \simeq f_1$.

7) The n -dimensional cartesian space is denoted by C^n .

$$\begin{aligned}
E^n &= \{(x_1, \dots, x_n) | \sum x_i^2 \leq 1\}, \quad S^n = \{(x_1, \dots, x_{n+1}) | \sum x_i^2 = 1\}, \\
E_{+i}^n &= \{(x_1, \dots, x_{n+1}) \in S^n | x_i \geq 0\}, \quad E_+^n = E_{+(n+1)}^n, \\
E_{-i}^n &= \{(x_1, \dots, x_{n+1}) \in S^n | x_i \leq 0\}, \quad E_-^n = E_{-(n+1)}^n, \\
S_i^n &= \{(x_1, \dots, x_{n+1}) \in S^n | x_i = 0\}, \quad y_* = (1, 0, \dots, 0): \\
(1.1) \quad I^n &= \{(x_1, \dots, x_n) | 0 \leq x_i \leq 1\}, \quad \dot{I}^n = \{(x_1, \dots, x_n) \in I^n | \prod x_i (1 - x_i) = 0\}, \\
I_+^n &= \{(x_1, \dots, x_n) \in I^n | x_n \geq \frac{1}{2}\}, \quad I_-^n = \{(x_1, \dots, x_n) \in I^n | x_n \leq \frac{1}{2}\}, \\
I_i^n &= \{(x_1, \dots, x_{n+1}) \in I^{n+1} | x_i = 0\}, \quad J_i^n = C1(\dot{I}_i^{n+1} - I_i^n), \\
\dot{I}_i^n &= J_i^n \cap I_i^n, \quad J^n = J_{n+1}^n, \quad J_0^n = C1(\dot{I}_n^{n+1} - I^{n-1}), \\
K_{ij}^n &= J_i^n \cap J_j^n, \quad K^n = K_{n,n+1}^n \text{ and } 0_* = (0, \dots, 0).
\end{aligned}$$

Thus $E^{n+1} \supset E^n \supset S^{n-1} \supset E_{+i}^{n-1} \supset S_i^{n-1}$, $E^{n+1} - \text{Int. } E^{n+1} = S^n = E_{+i}^n \cup E_{-i}^n$, $E_{+i}^n \cap E_{-i}^n = S_i^{n-1}$, $I^n \supset \dot{I}^n \supset J_i^{n-1} \supset K_{ij}^{n-1} \ni 0_*$ and $I^n - \text{Int. } I^n = \dot{I}^n = J_i^{n-1} \cup I_i^{n-1} = K_{ij}^{n-1} \cup I_i^{n-1} \cup I_j^{n-1}$.

Let

$$(1.2) \quad P_n: (J^n, \dot{I}^n, 0_*) \rightarrow (I^n, \dot{I}^n, 0_*)$$

$$\text{and} \quad P_n': (K^n; J^{n-1}, J_0^{n-1}, 0_*) \rightarrow (I^n; J^{n-1}, I^{n-1}, 0_*)$$

be projections from the points $(1/2, \dots, 1/2, -1) \in C^{n+1}$ and $(1/2, \dots, 1/2, 0, -1) \in C^{n+1}$ respectively, then P_n and P_n' are homeomorphisms.

Let $\rho_n(\theta): (E^{n+1}, S^n) \rightarrow (E^{n+1}, S^n)$ be the rotation through θ given by

$$(1.3) \quad \rho_n(\theta)(x_1, \dots, x_{n+1}) = (x_1, \dots, x_{n-1}, \cos \theta \cdot x_n - \sin \theta \cdot x_{n+1}, \sin \theta \cdot x_n + \cos \theta \cdot x_{n+1})$$

Define a mapping $d_n: (S^n \times E^1, S^n \times S^0 \cup y_* \times E^1) \rightarrow (S^{n+1}, y_*)$ by

$$\begin{aligned}
(1.4) \quad d_n(x, t) &= (t + (1-t)x_1, (1-t)x_2, \dots, (1-t)x_{n+1}, (2t(1-t)(1-x_1)^{\frac{1}{2}}) \quad 0 \leq t \leq 1, \\
&= (-t + (1+t)x_1, (1+t)x_2, \dots, (1+t)x_{n+1}, -(2-t(1+t)(1-x_1)^{\frac{1}{2}}) \quad -1 \leq t \leq 0,
\end{aligned}$$

then d_n maps $S^n \times E^1 - (S^n \times S^0 \cup y_* \times E^1)$ homeomorphically onto $S^{n+1} - y_*$, and

$$(1.4)' \quad d_n(E_{\pm i} \times E^1) = E_{\pm i}^{n+1} \text{ for } 1 \leq i \leq n+1.$$

Define a mapping $\psi_n: (I^n, \dot{I}^n) \rightarrow (S^n, y_*)$ inductively by setting

$$(1.5) \quad \psi_1(x_1) = \rho_1(2\pi x_1)(y_*)$$

$$\text{and} \quad \psi_n(x_1, \dots, x_n) = d_{n-1}(\psi_{n-1}(x_1, \dots, x_{n-1}), 2x_n - 1) \text{ for } n \geq 2,$$

then ψ_n maps $\text{Int. } I^n$ homeomorphically onto $S^n - y_*$.

Let $\varepsilon_1: (I^2, 0_*) \rightarrow (S^1, y_*)$ be a homeomorphism given by $\varepsilon_1(x_1, 0) = \rho(\pi x_1)(y_*)$, and for $x \in J^1$ by $\varepsilon_1(x) = \rho_1(\pi) \varepsilon_1 P_1(x)$.

Define homeomorphisms $\varepsilon_n: (I^{n+1}, 0_*) \rightarrow (S^n, y_*)$ and $\bar{\varepsilon}_n: (I^n, \dot{I}^n) \rightarrow (E^n, S^{n-1})$

inductively by setting $\bar{\varepsilon}_n \left(\frac{1+t(2x_1-1)}{2}, \dots, \frac{1+t(2x_n-1)}{2} \right) = (tx_1', \dots, tx_n')$ for

$(x_1', \dots, x_n') = \varepsilon_n(x_1, \dots, x_n)$ and $t \in I^1$, and by setting $\varepsilon_n(x) = p_-^{-1}(\bar{\varepsilon}_n(x))$ and $\varepsilon_n(P_n(x)) = p_+^{-1}(\bar{\varepsilon}_n(x))$ for $x \in I^n$, where $p_+ : E_+^n \rightarrow E^n$ and $p_- : E_-^n \rightarrow E^n$ are projections given by $p_+(x_1, \dots, x_{n+1}) = (x_1, \dots, x_n, 0)$. Note that (for $n > 1$)

$$(1.6) \quad \varepsilon_n(I^n) = E_-^n, \quad \varepsilon_n(J^n) = E_+^n \quad \text{and} \quad \varepsilon_n|_{\dot{I}^n} = \varepsilon_{n-1}.$$

The cells and their boundaries $I^n, \dot{I}^n, J^n, E^n, S^{n-1}, E_+^n$, and E_-^n are orientable such that ϕ_n, ε_n and p_- preserve the orientations and P_n and p_+ reverse the orientations.

Denote a subspace $S^n \times y_* \cup y_* \times S^q$ of $S^p \times S^q$ by $S^p \vee S^q$, and define a mapping $\varphi_n : (S^n; E_+^n, E_-^n, y_*) \rightarrow (S^n \vee S^n; S^n \times y_*, y_* \times S^n, y_* \times y_*)$ by $(x \in S^{n-1}, t \in E^1)$

$$(1.7) \quad \begin{aligned} \varphi_n(d_{n-1}(x, t)) &= (\rho_n(\pi/2) \circ d_{n-1}(x, 2t-1), y_*) & 0 \leq t \leq 1, \\ &= (y_*, \rho_n(-\pi/2) \circ d_{n-1}(x, 2t+1)) & -1 \leq t \leq 0. \end{aligned}$$

φ_n maps $\text{Int. } E_+^n$ and $\text{Int. } E_-^n$ homeomorphically onto $(S^n - y_*) \times y_*$ and $y_* \times (S^n - y_*)$ preserving orientations, and $\varphi_n(E_{+n}^n) = E_+^r \vee E_-^r$ and $\varphi_n(E_{-n}^n) = E_-^r \vee E_+^r$. Let $\sigma_n : (S^n \times S^n, S^n \vee S^n) \rightarrow (S^n \times S^n, S^n \vee S^n)$ be a homeomorphism given by

$$(1.8) \quad \sigma_n(x, y) = (y, x), \quad x, y \in S^n,$$

then we have

$$(1.9) \quad \sigma_n \circ \varphi_n = \varphi_n \circ \rho_n(\pi).$$

Define a mapping $\psi_{p,q} : (I^{p+q}, \dot{I}^{p+q}) \rightarrow (S^p \times S^q, S^p \vee S^q)$ by

$$(1.10) \quad \psi_{p,q}(x_1, \dots, x_{p+q}) = (\psi_p(x_1, \dots, x_p), \psi_q(x_{p+1}, \dots, x_{p+q})).$$

$\psi_{p,q}$ maps $\text{Int. } I^{p+q} = I^{p+q} - \dot{I}^{p+q}$ homeomorphically onto $S^p \times S^q - S^p \vee S^q$, hence there is unique mapping $\phi_{p,q} : (S^p \times S^q, S^p \vee S^q) \rightarrow (S^{p+q}, y_*)$ such that

$$(1.11) \quad \phi_{p,q} \circ \psi_{p,q} = \psi_{p+q}.$$

Define a mapping $\Phi_{p,q} : \dot{I}^{p+1} \times \dot{I}^{q+1} \times E^1 \rightarrow \dot{I}^{p+q+2}$ by

$$(1.12) \quad \begin{aligned} \Phi_{p,q}(x, y, t) &= ((1-t)x_1, \dots, (1-t)x_{p+1}, y_1, \dots, y_{q+1}) & 0 \leq t \leq 1, \\ &= (x_1, \dots, x_{p+1}, (1+t)y_1, \dots, (1+t)y_{q+1}) & -1 \leq t \leq 0, \end{aligned}$$

where $x = (x_1, \dots, x_{p+1}) \in \dot{I}^{p+1}$, $y = (y_1, \dots, y_{q+1}) \in \dot{I}^{q+1}$ and $t \in E^1$, then $\phi_{p,q}|_{\dot{I}^{p+1} \times \dot{I}^{q+1} \times \text{Int. } E^1}$ is a homeomorphism.

ii) homotopy groups

Define a sum $f +_i g : (I^n, \dot{I}^n) \rightarrow (X, x_0)$ of f and $g : (I^n, \dot{I}^n) \rightarrow (X, x_0)$ on the x_i -axis ($1 \leq i \leq n$) by

$$(1.13)_1 \quad \begin{aligned} (f +_i g)(x_1, \dots, x_n) &= f(x_1, \dots, x_{i-1}, 2x_i, x_{i+1}, \dots, x_n) & 0 \leq x_i \leq 1, \\ &= g(x_1, \dots, x_{i-1}, 2x_i - 1, x_{i+1}, \dots, x_n) & -1 \leq x_i \leq 0, \end{aligned}$$

and also define an inverse $-_i f : (I^n, \dot{I}^n) \rightarrow (X, x_0)$ of f by

$$(1.13)_2 \quad (-_t f)(x_1, \dots, x_n) = f(x_1, \dots, x_{t-1}, 1-x_t, x_{t+1}, \dots, x_n).$$

It is easily seen that the sums $f+_t g$ on different two axes are homotopic to each other, and the homotopy classes of f form the (*absolute*) *homotopy group* $\pi_n(X, x_0)$ with respect to the above addition.

A mapping $f: (S^n, y_*) \rightarrow (X, x_0)$ is called a *representative* of $\alpha \in \pi_n(X, x_0)$ if the homotopy class of the composite map $f \circ \psi_n: (I^n, I^n) \rightarrow (X, x_0)$ is α . Define a *sum* $f+g$ of f and $g: (S^n, y_*) \rightarrow (X, x_0)$ and an *inverse* $-f$ of f by

$$(1.14) \quad \begin{aligned} (f+g)(d_{n-1}(x, t)) &= f(d_{n-1}(x, 2t+1)) \quad -1 \leq t \leq 0, \\ &= g(d_{n-1}(x, 2t-1)) \quad 0 \leq t \leq 1, \end{aligned}$$

$$\text{and} \quad (-f)(d_{n-1}(x, t)) = f(d_{n-1}(x, -t)),$$

then $\psi_n(f+g) = \psi_n(f) +_n \psi_n(g)$, $\psi_n(-f) = -_n \psi_n(f)$ and $\psi_n(f) \simeq \psi_n(g)$ implies $f \simeq g$. Therefore $\pi_n(X, x_0)$ may be regarded as the set of the homotopy classes of $f: (S^n, y_*) \rightarrow (X, x_0)$ with addition in (1.14).

A mapping $f: (I^{n+1}, 0_*) \rightarrow (X, x)$ is called a *representative* of $\alpha \in \pi_n(X, x_0)$ if there is a mapping $f': (I^{n+1}, 0) \rightarrow (X, x_0)$ such that $f \simeq f'$, $f'(J^n) = x_0$ and the class of $f'|I^n: (I^n, I^n) \rightarrow (X, x_0)$ is α . It is not so difficult to show that

(1.15) *If $f: (S^n, y_*) \rightarrow (X, x_0)$ is a representative of α , then the composite map $f \circ \varepsilon_n: (I^{n+1}, 0_*) \rightarrow (X, x_0)$ is also a representative of α .*

The *relative homotopy group* $\pi_n(X, A, x_0)$ is a set of homotopy classes of mappings $(I^n, I^{n-1}, J^{n-1}) \rightarrow (X, A, x_0)$ with addition which is represented by a sum and an inverse on the x_i -axis ($1 \leq i \leq n-1$) as in (1.13)₁ and (1.13)₂. A mapping $f: (I^n, I^n, 0_*) \rightarrow (X, A, x_0)$ is called a *representative* of $\alpha \in \pi_n(X, A, x_0)$ if there is a mapping $f': (I^n, I^n, 0_*) \rightarrow (X, A, x_0)$ such that $f \simeq f'$, $f'(J^n) = x_0$ and the class of $f': (I^n, I^{n-1}, J^{n-1}) \rightarrow (X, A, x_0)$ is α . Also a mapping $f: (E^n, S^{n-1}, y_*) \rightarrow (X, A, x_0)$ is called a *representative* of $\alpha \in \pi_n(X, A)$, if the composite map $f \circ \varepsilon_n: (I^n, I^n, 0_*) \rightarrow (X, A, x_0)$ is a representative of α .

The *triad homotopy group* $\pi_n(X; A, B, x_0)$ is a set of homotopy classes of mappings $(I^n; I_+^{n-1}, I_-^{n-1}, J^{n-1}) \rightarrow (X; A, B, x_0)$ with addition which is represented by a sum and an inverse on the x_i -axis ($1 \leq i \leq n-2$) as in (1.13). Since $\psi_{n-1}: (I^{n-1}, I^{n-1}) \rightarrow (S^{n-1}, y_*)$ maps I_+^{n-1} and I_-^{n-1} to E_+^{n-1} and E_-^{n-1} respectively, there is a mapping $\bar{\psi}_n: (I^n; I_+^{n-1}, I_-^{n-1}, J^n) \rightarrow (E^n; E_+^n, E_-^n, y_*)$ such that $\bar{\psi}_n|I^{n-1} = \psi_{n-1}$ and $\bar{\psi}_n$ maps $I^n - J^{n-1}$ homeomorphically onto $E^n - y_*$. As is easily seen, any extensions $\bar{\psi}_n^1$ of $\psi_{n-1} = \bar{\psi}_n|I^{n-1}$ are homotopic to each other. A mapping $f: (E^n; E_+^{n-1}, E_-^{n-1}, y_*) \rightarrow (X; A, B, x_0)$ is called a *representative* of $\alpha \in \pi_n(X; A, B, x_0)$ if the composite map $f \circ \bar{\psi}_n: (I^n; I_+^{n-1}, I_-^{n-1}, J^{n-1}) \rightarrow (X, A, B, x_0)$ represents α . Also a mapping $f: (I^n; J^{n-1}, I^{n-1}, 0_*) \rightarrow (X; A, B, x_0)$ is called a

8) The existence of such mapping is clear.

representative of α , if the composite map $f \circ \bar{\varepsilon}_n^{-1}: (E^n; E_+^{n-1}, E_-^{n-1}, j_*) \rightarrow (X; A, B, x_0)$ is a representative of α .

Let $f: (X, x_0) \rightarrow (Y, y_0)$ be a mapping, for any mappings g_1 and $g_2: (I^n, I^n) \rightarrow (X, x_0)$ we have that $g_1 \simeq g_2$ implies $f \circ g_1 \simeq f \circ g_2$ and that $f \circ (g_1 + i g_2) = (f \circ g_1) + i(f \circ g_2)$. Therefore f induces a homomorphism

$$(1.16) \quad f^*: \pi_n(X, x_0) \rightarrow \pi_n(Y, y_0).$$

Similarly mappings $f_1: (X, A, x_0) \rightarrow (Y, B, y_0)$ and $f_2: (X; A, B, x_0) \rightarrow Y; C, D, y_0)$ induce homomorphisms

$$(1.16)' \quad f_1^*: \pi_n(X, A, x_0) \rightarrow \pi_n(Y, B, y_0),$$

$$\text{and} \quad f_2^*: \pi_n(X; A, B, x_0) \rightarrow \pi_n(Y; C, D, y_0).$$

The mapping $f: (I^n, I^n) \rightarrow (X, x_0)$ is regarded as the mapping $f: (I^n, I^{n-1}, J^{n-1}) \rightarrow (X, x_0, x_0)$ and this implies the natural isomorphism

$$(1.17) \quad j'; \pi_n(X, x_0) \rightarrow \pi_n(X, x_0, x_0).$$

The mapping $f: (I^n, I^{n-1}, J^{n-1}) \rightarrow (X, B, x_0)$ is regarded as the mapping $f: (I^n; J^{n-1}, I^{n-1}, K^{n-1}) \rightarrow (X; x_0, B, x_0)$ and this implies the natural isomorphism

$$(1.17)' \quad j': \pi_n(X, B, x_0) \rightarrow \pi_n(X; x_0, B, x_0).$$

Define a boundary $\partial f: (I^{n-1}, I^{n-1}) \rightarrow (A, x_0)$ of $f: (I^n, I^{n-1}, J^{n-1}) \rightarrow (X, A, x_0)$ by $\partial f = f|I^{n-1}$, then $f \simeq g$ implies $\partial f \simeq \partial g$ and $\partial(f + i g) = \partial f + i \partial g$ for $1 \leq i \leq n-1$. Therefore we obtain *the boundary homomorphism*

$$(1.18) \quad \partial; \pi_n(X, A, x_0) \rightarrow \pi_{n-1}(A, x_0) \text{ for } n \geq 2$$

Define a boundary $\beta_+ f: (I^{n-1}; I^{n-2}, J^{n-2}) \rightarrow (A, A \cap B, x_0)$ of $f: (I^n; I_+^{n-1}, I_-^{n-1}, J^{n-1}) \rightarrow (X; A, B, x_0)$ by $\beta_+ f(x_1, \dots, x_n) = f(x_1, \dots, x_{n-2}, 2x_{n-1}-1, 0)$ then $f \simeq g$ implies $\beta_+ f \simeq \beta_+ g$ and $\beta_+(f + i g) = \beta_+ f + i \beta_+ g$ for $1 \leq i \leq n-2$. Therefore we obtain *the boundary homomorphism*

$$(1.18)' \quad \beta_+; \pi_n(X; A, B, x_0) \rightarrow \pi_{n-1}(A, A \cap B, x_0) \text{ for } n \geq 3.$$

The following properties are well known,

- (1.19) i) If f is the identity map, then f^* is the identity homomorphism.
 ii) $(f \circ g)^* = f^* \circ g^*$.
 iii) $f \simeq g$ implies $f^* = g^*$.

(1.20) The sequence of the homomorphisms

$$\cdots \longrightarrow \pi_n(X, x_0) \xrightarrow{j} \pi_n(X, A, x_0) \xrightarrow{\partial} \pi_{n-1}(A, x_0) \xrightarrow{i^*} \pi_{n-1}(X, x_0) \longrightarrow \cdots \quad (n \geq 1)$$

is *exact*, where $i: A \rightarrow X$ is the injection and j^* is the composite homomorphism $\pi_n(X, x_0) \xrightarrow{j'} \pi_n(X, x_0, x_0) \xrightarrow{\text{injection}} \pi_n(X, A, x_0)$. And also the sequence of the homomorphisms

$$\cdots \rightarrow \pi_n(X, B, x_0) \xrightarrow{j'} \pi_n(X; A, B, x_0) \xrightarrow{\beta_+} \pi_{n-1}(A, A \cap B, x_0) \xrightarrow{i^*} \pi_{n-1}(X, B, x_0) \rightarrow \cdots$$

($n \geq 2$)

is *exact*, where $i: (A, A \cap B, x_0) \rightarrow (X, B, x_0)$ is the injection and j^* is the composite homomorphism $\pi_n(X, B, x_0) \xrightarrow{j'} \pi_n(X; x_0, B, x_0) \rightarrow \pi_n(X; A, B, x_0)$.

(1.21) In the following diagrams the commutativity relations hold;

$$\begin{array}{ccccccc} \cdots \rightarrow & \pi_n(X, x_0) & \rightarrow & \pi_n(X, A, x_0) & \rightarrow & \pi_{n-1}(A, x_0) & \rightarrow \pi_{n-1}(X, x_0) \rightarrow \cdots \\ & \downarrow f^* & & \downarrow f^* & & \downarrow (f|A)^* & \downarrow f^* \\ \cdots \rightarrow & \pi_n(Y, y_0) & \rightarrow & \pi_n(Y, B, y_0) & \rightarrow & \pi_{n-1}(B, y_0) & \rightarrow \pi_{n-1}(X, y_0) \rightarrow \cdots \end{array}$$

and

$$\begin{array}{ccccccc} \cdots \rightarrow & \pi_n(X, B, x_0) & \rightarrow & \pi_n(X; A, B, x_0) & \rightarrow & \pi_{n-1}(A, A \cap B, x_0) & \rightarrow \pi_{n-1}(X, B, x_0) \rightarrow \cdots \\ & \downarrow g^* & & \downarrow g^* & & \downarrow (g|A)^* & \downarrow g^* \\ \cdots \rightarrow & \pi_n(Y, D, y_0) & \rightarrow & \pi_n(Y; C, D, y_0) & \rightarrow & \pi_{n-1}(C, C \cap D, y_0) & \rightarrow \pi_{n-1}(Y, D, y_0) \rightarrow \cdots \end{array}$$

where $f: (X, A, x_0) \rightarrow (Y, B, y_0)$ and $g: (X; A, B, x_0) \rightarrow (Y; C, D, y_0)$ are mappings.

Definition (1.22) $\pi_0(X)=0$ if and only if X is arcwise connected, $\pi_1(X, A, x_0)=0$ if and only if the injection homomorphism $i^*: \pi_1(A, x_0) \rightarrow \pi_1(X, x_0)$ is onto, and $\pi_2(X; A, B, x_0)=0$ if and only if the injection homomorphism $i^*: \pi_2(A, A \cap B, x_0) \rightarrow \pi_2(X, B, x_0)$ is onto.

X is called *n-connected* if $\pi_i(X, x_0)=0$ for $0 \leq i \leq n$. (X, A, x_0) is called *n-connected* if $\pi_0(A, x_0)=\pi_0(X, x_0)=0$ and $\pi_i(X, A, x_0)=0$ for $1 \leq i \leq n$. $(X; A, B, x_0)$ is called *n-connected* if $(A, A \cap B, x_0)$ and $(B, A \cap B, x_0)$ are 1-connected and $\pi_i(X; A, B, x_0)=0$ for $2 \leq i \leq n$.

iii) The main theorem of Blakers and Massey [3] is described without restriction in lower dimension;

Theorem (1.23) If $X=(Int A) \cup (Int B)$, $(A, A \cap B)$ is *m-connected* and $(B, A \cap B)$ is *n-connected*, then the triad $(X; A, B)$ is *(m+n)-connected* ($m \geq n \geq 1$).

For the case $n \geq 2$, the proof of theorem was given in [3].

We shall prove this theorem for the case $n=1$. With normalization process in §3 of [3], any elements of $\pi_q(X; A, B)$ is represented by normal form $f: (I^q; I^{q-1}, J^{q-1}) \rightarrow (X; A, B)$ such that

$$f^{-1}(A) \supset \bar{N}(M) \cup I^{q-1} \quad \text{and} \quad f^{-1}(B) \supset C1(I^q - \bar{N}(M)).$$

Suppose $2 \leq q \leq m+1$, then $\dim M \leq q-m-1 \leq 0$, and therefore $\bar{N}(M) = \bigcup_i \sigma_i^q + \bigcup_j \tau_j^q$, where σ_i^q and τ_j^q are finite number of disjoint rectilinear closed cells in $I^q - J^{q-1}$ such that $\sigma_i^q \cap I^{q-1} = \emptyset$ and $\tau_j^q \cap I^{q-1}$ are faces of τ_j^q .

Since $q \geq 2$, we can take segments t_j from each point of τ_j^q to point of I^{q-1} in $I^q - \bar{N}(M)$, such that t_j are disjoint to each other. Set $P = \bigcup_j t_j \cup \bar{N}(M) \cup I^{q-1}$ and $Q = C1(I^q - P^r)$, then interior of Q is an open q -cell and its boundary is $(P \cap Q) \cup J^{q-1}$ and $(P \cap Q) \cap J^{q-1} = I^{q-1}$. Therefore $P \cap Q$ is a retract of Q and

let its retraction be $r_t: Q \rightarrow P \cap Q$.

Since $(B, A \cap B)$ is 1-connected, $f|_{\bigcup_j t_j}$ is deformable into $A \cap B$ relative to $\bigcup_j t_j$, and extendable to whole homotopy of $(I^q; I^{q-1}, J^{q-1})$ such that the resulted map $f_1: (I^q; I^{q-1}, J^{q-1}) \rightarrow (X; A, B)$ satisfies the conditions

$$f_1^{-1}(A) \supset P \quad \text{and} \quad f_1^{-1}(B) \supset Q.$$

Equations $f_{1+t}|_Q = f_1 \circ r_t$ and $f_{1+t}|_P = f_1|_P$ define a homotopy of $f_1 \simeq f_2$, and f_2 maps I^q in A . Also a retraction of I^q leads a null-homotopy of f_2 and null-homotopy of f . Consequently any element of $\pi_q(X; A, B)$ is trivial for $2 \leq q \leq m+1$, and the proof of theorem is completed.

Let $\overline{A \cap B}$, \bar{A} , \bar{B} and \bar{X} be subspaces of $X \times I^1$ given by $\overline{A \cap B} = (A \cap B) \times I^1$, $\bar{A} = A \times (0) \cup \overline{A \cap B}$, $\bar{B} = B \times (1) \cup \overline{A \cap B}$ and $\bar{X} = \bar{A} \cup \bar{B}$, and let $\phi': (\bar{A}, (A \cap B) \times (1)) \rightarrow (\bar{A}, x_0)$ and $\phi: (A, A \cap B) \rightarrow (\bar{A}, x_0)$ be mappings identifying the subsets $(A \cap B) \times (1)$ and $A \cap B$ to single points.

For convenience we shall give a sufficient condition to omit the condition $X = \text{Int. } A \cup \text{Int. } B$ of (1.23).

Definition (1.24) The pair $(A, A \cap B)$ is *smooth* if and only if there is a homotopy $h_t: (A, A \cap B) \rightarrow (\bar{A}, \bar{A} \cap \bar{B})$ such that $h_t(x) = (x, t)$ for $x \in A \cap B$.

Lemma (1.25) i) If $(A, A \cap B)$ is smooth and $X = A \cup B$, then triads $(X; A, B)$ and $(\bar{X}; \bar{A}, \bar{B})$ have the same homotopy type.

ii) If \bar{A} is a retract of $A \times I^1$, then $(A, A \cap B)$ is smooth, and a combinatorial pair (K, L) is also smooth.

iii) Let $\phi: (X, A) \rightarrow (Y, B)$ be a mapping such that $\phi|_{X-A}$ is homeomorphism onto $Y-B$, and if (X, A) is smooth then (Y, B) is also smooth.

iv) If $(A, A \cap B)$ is smooth then $(\bar{A}, (A \cap B) \times (1))$ and $(A, A \cap B)$ have the same homotopy types.

v) If (X, A) is smooth, then $(X \times I^1, X \times I^1 \cup A \times I^1)$ and $(X \times I^1, X \times (0) \cup A \times I^1)$ are also smooth.

From the lemma we have (Cf. [3])

Theorem (1.25) If $(A, A \cap B)$ is smooth and m -connected, $(B, A \cap B)$ is n -connected, $A \cap B$ is r -connected and $X = A \cup B$, then

- i) $(X; A, B)$ is $(m+n)$ -connected,
- ii) the induced homomorphisms $\phi^*: \pi_p(A, A \cap B) \rightarrow \pi_p(\bar{A}, x_0)$ are onto for $p \leq m+n+1$ and isomorphic for $p \leq m+n$,
- iii) and the injection homomorphisms $i^*: \pi_p(A, A \cap B) \rightarrow \pi_p(X, B)$ are isomorphisms into for $p \leq m+r$ and their image are direct factors of $\pi_p(X, B)$, and we have $\pi_p(X, B) \approx \pi_p(A, A \cap B) \cup \pi_p(X; A, B)$.

Let $\chi_i: (E^n, S^{n-1}, y_*) \rightarrow (X^*, X, x_0)$ be mappings such that $\chi_i|_{E^n - S^{n-1}}$ are homeomorphisms, $\bigcup_i \chi_i(E^n - S^{n-1}) = X^* - X$ and $\chi_i(E^n - S^{n-1})$ are disjoint to

each other. The mappings χ_i will be referred to us *characteristic maps*, and we denote $\varepsilon_i^n = \chi_i(E^n)$, $\dot{\varepsilon}_i^n = \chi_i(S^{n-1})$, $\varepsilon^n = \bigcup_i \varepsilon_i^n$ and $\dot{\varepsilon}^n = \bigcup_i \dot{\varepsilon}_i^n$. By iii) of (1.25), $(\varepsilon^n, \dot{\varepsilon}^n)$ is smooth and the theorem (1.26) is available for the triad $(X^*; \varepsilon^n, X)$.

Set $E_{\frac{1}{2}}^n = \{(x_1, \dots, x_{n+1}) | \sum_i^n = 1/4\}$, $\sigma_i^n = \chi_i(E_{\frac{1}{2}}^n \cup [1/2, 1])$, $Y_i = \varepsilon_i^n - \text{Int. } \sigma_i^n$, $\sigma^n = \bigcup_i \sigma_i^n$ and $Y = \bigcup_i Y_i$. The pairs $(\varepsilon^n, \dot{\varepsilon}^n)$ and (ε^n, Y) have the same homotopy type, and in the exact sequence $\dots \rightarrow \pi_p(\sigma^n, \dot{\sigma}^n) \xrightarrow{i^*} \pi_p(\varepsilon^n, Y) \rightarrow \pi_p(\varepsilon^n; \sigma^n, Y) \rightarrow \pi_{p-1}(\varepsilon^n, \dot{\sigma}^n) \dots$, i^* is equivalent to a homomorphism: $\chi^*: \sum_i \pi_p(E^n, S^{n-1}) \rightarrow \pi_p(\varepsilon^n, \dot{\varepsilon}^n)$ which is given by $\chi^*(a_1 + \dots + a_i + \dots) = \chi_1^*(a_1) + \dots + \chi_i^*(a_i) + \dots$. From i) and iii) of (1.26) we have

Corollary. (1.27) $\chi^*: \sum_i \pi_p(E^n, S^{n-1}) \rightarrow \pi_p(\varepsilon^n, \dot{\varepsilon}^n)$ are isomorphisms into and $\pi_p(\varepsilon^n, \dot{\varepsilon}^n) \approx \sum_i \pi_p(E^n, S^{n-1}) \oplus \pi_p(\varepsilon^n; \sigma^n, Y)$ for $p \leq 2n-3$, and if $\dot{\varepsilon}^n$ is m -connected χ^* is onto for $p \leq n + \text{Min.}(m, n-1) - 1$.

Chapter 2. Suspension, Products and Hopf construction.

i) Suspension

Let $d: (X \times E^1, X \times S^0 \cup x_0 \times E^1) \rightarrow (E(X), x_0)$ be a map identifying the subset $X \times S^0 \cup x_0 \times E^1$ to the single point x_0 , and denote $\hat{X}_+ = d(X \times [0, 1])$ and $\hat{X}_- = d(X \times [-1, 0])$. $E(X)$ is called a *suspended space* of X , and we identify the point x of X to the point $(x, 0)$ of $E(X)$, thus $E(X) = \hat{X}_+ \cup \hat{X}_-$ and $X = \hat{X}_+ \cap \hat{X}_-$. S^{n+1} is a suspended space of S^n with respect to the shrinking map d_n of (1.4).

Define a *sum* $f+g$ of f and $g: (E(X), x_0) \rightarrow (Y, y_0)$ and an *inverse* $-f$ of f by

$$(2.1) \quad \begin{aligned} (f+g)(d(x, t)) &= f(d(x, 2t-1)) & 0 \leq t \leq 1, \\ &= g(d(x, 2t+1)) & -1 \leq t \leq 0, \\ (-f)(d(x, t)) &= f(d(x, -t)) & -1 \leq t \leq 0, \end{aligned}$$

then the homotopy classes of f form a group, which coincide to the fundamental group of the function space $Y_0^X = \{f: X \rightarrow Y | f(x_0) = y_0\}$, with reference point $f_0: X \rightarrow y_0$.

A *suspension (map)* $Ef: (I^{n+1}, I^{n+1}) \rightarrow (E(X), x_0)$ of $f: (I^n, I^n) \rightarrow (X, x_0)$ is defined by

$$(2.2) \quad Ef(x_1, \dots, x_{n+1}) = d(f(x_1, \dots, x_n), 2x_{n+1}-1),$$

then we have $E(f+_i g) = Ef+_i Eg$ and $E(-_i f) = -_i Ef$ for $1 \leq i \leq n$, and therefore we obtain the suspension homomorphism

$$(2.3) \quad E: \pi_n(X, x_0) \rightarrow \pi_{n+1}(E(X), x_0).$$

For $f: (I^n, I^n) \rightarrow (X, x_0)$ and $g_1, g_2: (E(X), x_0) \rightarrow (Y, y_0)$ we have

$$(2.4) \quad (g_1+g_2) \circ Ef = g_1 \circ Ef +_{n+1} g_2 \circ Ef \text{ and } (-g) \circ Ef = -_{n+1}(g \circ Ef).$$

Since \hat{X}_+ and \hat{X}_- are contractible, the exactness of the homotopy sequences

of the pairs (\hat{X}_+, X, x_0) and $(E(X), \hat{X}_-, x_0)$ lead that the homomorphisms $\partial: \pi_{n+1}(\hat{X}_+, X, x_0) \rightarrow \pi_n(X, x_0)$ and $j^*: \pi_n(E(X), x_0) \rightarrow \pi_n(E(X), \hat{X}_-, x_0)$ are isomorphisms onto. Consider the diagram

$$(2.5) \quad \begin{array}{ccccccc} \cdots \pi_{n+1}(E(X); \hat{X}_+, \hat{X}_-) & \xrightarrow{\beta_+} & \pi_n(X_+, X) & \xrightarrow{i^*} & \pi_n(E(X), \hat{X}_-) & \xrightarrow{j^*} & \pi_n(E(X); \hat{X}_+, \hat{X}_-) \rightarrow \cdots \\ & \searrow \Delta & \downarrow \partial & & \uparrow j^{*'} & \swarrow I & \\ & & \pi_{n-1}(X) & \xrightarrow{E} & \pi_n(E(X)) & & \end{array}$$

where $\Delta = \partial \circ \beta_+$ and $I = j^{*'} \circ j^*$. It is easily verified that $E = j^*_{-1} \circ i^* \circ \partial^{-1}$ and that the sequence of the homomorphisms $\cdots \xrightarrow{\Delta} \xrightarrow{E} \xrightarrow{I} \cdots$ is exact. By (1.23), v) of (1.25) and i) of (1.26),

(2.6) *if X is r -connected and smooth, then $(E(X), \hat{X}_+, \hat{X}_-)$ is $(2r+2)$ -connected and therefore the suspension homomorphisms $E: \pi_n(X) \rightarrow \pi_{n+1}(E)$ are isomorphic for $n \leq 2r$ and onto for $n = 2r+1$.*

Note that

(2.7) *if $f: (I^{n+1}, \dot{I}^{n+1}) \rightarrow (I^{r+1}, \dot{I}^{r+1})$ is a map such that $\epsilon_n \circ (f| \dot{I}^{n+1})$ is a representative of an element $\alpha \in \pi_n(S^r)$ and if $g: (I^{r+1}, \dot{I}^{r+1}) \rightarrow (X_0, x_0)$ is a representative of $\beta \in \pi_{r+1}(X)$, then the composite mapping $g \circ f: (I^{n+1}, \dot{I}^{n+1}) \rightarrow (X, x_0)$ represents $\beta \circ E(\alpha) \in \pi_n(X, x_0)$.*

Define a mapping $D^n: (X \times I^n, X \times \dot{I}^n \cup x_0 \times I^n) \rightarrow (E^n(X), x)$ inductively by setting $D^1 = d$ and $D^n(x, (x_1, \dots, x_n)) = d(D^{n-1}(x, (x_1, \dots, x_{n-1}), 2x_{n-1}-1)$, where $E^n(X)$ indicates the n -fold suspended space of X . Since D^n maps $X \times I^n - (X \times \dot{I}^n \cup x_0 \times I^n)$ homeomorphically onto $E^n(X) - x_0$, we can define a mapping $\phi_n: (X \times S^n, X \vee S^n) \rightarrow (E^n(X), x_0)$ such that

$$(2.8) \quad \phi_n(x, \phi_n(y)) = D^n(x, y) \quad x \in X, y \in I^n.$$

Define a product $f \times g: (I^{p+q}, \dot{I}^{p+q}) \rightarrow (A \times B, A \vee B)$ of $f: (I^p, \dot{I}^p) \rightarrow (A, a_0)$ and $g: (I^q, \dot{I}^q) \rightarrow (B, b_0)$ by

$$(2.9) \quad (f \times g)(x_1, \dots, x_{p+q}) = (f(x_1, \dots, x_p), g(x_{p+1}, \dots, x_{p+q})),$$

then $f \simeq f', g \simeq g'$ implies $f \times g \simeq f' \times g'$ and hence a product $\alpha \times \beta \in \pi_{p+q}(A \times B, A \vee B)$ of $\alpha \in \pi_p(A)$ and $\beta \in \pi_q(B)$ is defined. If $f: (I^m, \dot{I}^m) \rightarrow (X, x_0)$ is a representative of $\alpha \in \pi_n(X)$, we have by (2.8) $\phi_n(f \times \phi_n)(x, (y_1, \dots, y_n)) = D^n(f(x), (y_1, \dots, y_n)) = d(D^{n-1}(f(x), (y_1, \dots, y_{n-1}), 2y_n-1) = E D^{n-1}(f(x), (y_1, \dots, y_{n-1})) = \cdots = E^n f(x)$, in which E^n indicates the n -fold suspension. Therefore

$$(2.10) \quad \phi_n^*(\alpha \times \iota_n) = E^n(\alpha), \text{ when } \iota_n^{9)} \text{ is the generator of } \pi_n(S^n) \text{ represented by } \phi_n.$$

Finally we remark that the suspension Ef of $f: (I^n, \dot{I}^n) \rightarrow (X, x_0)$ satisfies the condition $f(I_+^{n+1}) \subset \hat{X}_+, f(I_-^{n+1}) \subset \hat{X}_-$ and $Ef(x_1, \dots, x_n, \frac{1}{2}) = f(x_1, \dots, x_n)$,

9) This notation: $\iota_n \in \pi_n(S^n)$ will be used through the paper.

and that if a map $F: (I^{n+1}, I^{n+1}) \rightarrow (E(X), x_0)$ satisfies this condition then we have $Ef \simeq F$.

ii) Products.

The original *product* of J. H. C. Whitehead $[f, g]: (I^{p+q}, 0) \rightarrow (X, x_0)$ of $f: (I^p, I^p) \rightarrow (X, x_0)$ and $g: (I^q, I^q) \rightarrow (X, x_0)$ is given by

$$(2.11) \quad \begin{aligned} [f, g](x_1, \dots, x_{p+q}) &= f(x_1, \dots, x_p) & (x_{p+1}, \dots, x_{p+q}) \in I^q, \\ &= g(x_{p+1}, \dots, x_{p+q}) & (x_1, \dots, x_p) \in I^p, \\ \text{or} \quad [f, g](\phi_{p,q}(x, y, t)) &= f((1-t)x_1, \dots, (1-t)x_p) & 0 \leq t \leq 1, \\ &= g((1+t)y_1, \dots, (1+t)y_q) & -1 \leq t \leq 0. \end{aligned}$$

If f_t and g_t are homotopies, then $[f_t, g_t]$ is a homotopy from $[f_0, g_0]$ to $[f_1, g_1]$ and therefore the product $[\alpha, \beta] \in \pi_{p+q-1}(X, x_0)$ of $\alpha \in \pi_p(X, x_0)$ and $\beta \in \pi_q(X, x_0)$ can be defined. Let $i_1: A \rightarrow A \vee B$ and $i_2: B \rightarrow A \vee B$ are injections such that $i_1(a) = (a, b_0)$ and $i_2(b) = (a_0, b)$. By (2.9) and (2.11) we have for $f: (I^p, I^p) \rightarrow (A, a_0)$ and $g: (I^q, I^q) \rightarrow (B, b_0)$

$$(2.12) \quad [i_1 \circ f, i_2 \circ g] = f \times g | I^{p+q}.$$

Let $f: (S^p, y) \rightarrow (X, x_0)$ and $g: (S^q, y_*) \rightarrow (X, x_0)$ be representatives of $\alpha \in \pi_p(X)$ and $\beta \in \pi_q(X)$ respectively and let $f \vee g: (S^p \vee S^q, y_* \times y_*) \rightarrow (X, x_0)$ be a mapping such that $(f \vee g)(x, y_*) = f(x)$ and $(f \vee g)(y_*, x') = g(x')$ for $x \in S^p$ and $x' \in S^q$. Then the composite map

$$(2.13) \quad (f \vee g) \circ \psi_{p,q}: (I^{p+q}, 0_*) \rightarrow (S^p \vee S^q, y_* \times y_*) \rightarrow (X, x_0)$$

is a representative of $[\alpha, \beta]$.

Now we define a (*relative*) *product* $[\alpha, \beta]_r \in \pi_{p+q-1}(X, A, x_0)$ of $\alpha \in \pi_p(A, x_0)$ and $\beta \in \pi_q(X, A, x)$. Let $f: (I^p, I^p) \rightarrow (A, x_0)$ and $g: (I^q, I^{q-1}, J^{q-1}) \rightarrow (X, A, x_0)$ be representatives of α and β respectively. Define a mapping $(f, g)_r: (J^{p+q-1}, I^{p+q-1}, 0_*) \rightarrow (X, A, x_0)$ by

$$(2.14)' \quad \begin{aligned} (f, g)_r(x_1, \dots, x_{p+q}) &= f(x_1, \dots, x_p) & (x_{p+1}, \dots, x_{p+q}) \in J^{q-1}, \\ &= g(x_{p+1}, \dots, x_{p+q}) & (x_1, \dots, x_p) \in I^p, \end{aligned}$$

and define a relative product $[f, g]_r: (I^{p+q-1}, I^{p+q-1}, 0_*) \rightarrow (X, A, x_0)$ of f and g by

$$(2.14) \quad [f, g]_r = (f, g)_r \circ P_{p+q-1}.$$

$f \simeq f'$ and $g \simeq g'$ imply $[f, g]_r \simeq [f', g']_r$ and $[f, g]_r$ is a representative of the relative product $[\alpha, \beta]_r$.

Next we define a (*triad*) *product* $[\alpha, \beta]_t \in \pi_{p+q-1}(X; A, B, x_0)$ of $\alpha \in \pi_p(B, A \cap B, x_0)$ and $\beta \in \pi_q(A, A \cap B, x_0)$. Let $f: (I^p, I^{p-1}, J^{p-1}) \rightarrow (B, A \cap B, x_0)$ and $g: (I^q, I^{q-1}, J^{q-1}) \rightarrow (B, A \cap B, x_0)$ be representatives of α and β respectively. Define a mapping $(f, g)_t: (K^{p+q-1}; J^{p+q-2}, J_0^{p+q-2}, 0_*) \rightarrow (X; A, B, x_0)$ by

$$(2.15)' \quad (f, g)_t(x_1, \dots, x_{p+q}) = f(x_1, \dots, x_{p-1}, x_{p+q}) \quad (x_p, \dots, x_{p+q-1}) \in J^{q-1}, \\ = g(x_p, \dots, x_{p+q-1}) \quad (x_1, \dots, x_{p-1}, x_{p+q}) \in J^{p-1},$$

and define a *triad product* $[f, g]_t: (I^{p+q-1}; J^{p+q-2}, J_0^{p+q-2}, 0) \rightarrow (X; A, B, x_0)$ of f and g by

$$(2.15) \quad [f, g]_t = (f, g)_t \circ P'^{-1}_{p+q-1},$$

$f \simeq f'$ and $g \simeq g'$ imply $[f, g]_t \simeq [f', g']_t$ and $[f, g]_t$ is a representative of $[a, \beta]_t$.

We have

$$(2.16) \quad [a, \beta_1 + \beta_2] = [a, \beta_1] + [a, \beta_2] \quad a \in \pi_p(X), \beta_1, \beta_2 \in \pi_q(X) \quad (q > 1), \\ [a_1 + a_2, \beta] = [a_1, \beta] + [a_2, \beta] \quad a_1, a_2 \in \pi_p(X), \beta \in \pi_q(X) \quad (p > 1), \\ [a, \beta_1 + \beta_2]_r = [a, \beta_1]_r + [a, \beta_2]_r \quad a \in \pi_p(A), \beta_1, \beta_2 \in \pi_q(X, A) \quad (q > 2), \\ [a_1 + a_2, \beta]_r = [a_1, \beta]_r + [a_2, \beta]_r \quad a_1, a_2 \in \pi_p(A), \beta \in \pi_q(X, A) \quad (p > 1), \\ [a, \beta_1 + \beta_2]_t = [a, \beta_1]_t + [a, \beta_2]_t \quad a \in \pi_p(B, A \cap B), \beta_1, \beta_2 \in \pi_q(A, A \cap B) \quad (q > 2), \\ [a_1 + a_2, \beta]_t = [a_1, \beta]_t + [a_2, \beta]_t \quad a_1, a_2 \in \pi_p(B, A \cap B), \beta \in \pi_q(A, A \cap B) \quad (p > 2), \\ (2.17) \quad f^*[a, \beta] = [f^*(a), f^*(\beta)] \quad a \in \pi_p(X), \beta \in \pi_q(X), \\ f^*[a, \beta]_r = [f^*_1(a), f^*(\beta)]_r \quad a \in \pi_p(A), \beta \in \pi_q(X, A), \\ f^*[a, \beta]_t = [f^*_2(a), f^*_1(\beta)]_t \quad a \in \pi_p(B, A \cap B), \beta \in \pi_q(A, A \cap B),$$

for $f: (X; A, B, x_0) \rightarrow (Y; C, D, y_0)$, $f_1 = f|A$ and $f_2 = f|B$.

From the definitions of products and boundaries, we have $\partial[f, g]_r = [f, \partial g]$ and $\beta_+[f, g]_t = [\partial f, g]_r$, and we have

$$(2.18) \quad \partial[a, \beta]_r = [a, \partial\beta] \quad \text{and} \quad \beta_+[a, \beta]_t = [\partial a, \beta]_r.$$

Next consider a product $[a, j^*(\beta)]$, where $a \in \pi_p(A)$, $\beta \in \pi_q(X)$ and j^* is the natural homomorphism $\pi_q(X) \rightarrow \pi_q(X, A)$. Let $f: (I^p, i^p) \rightarrow (A, x_0)$ and $g: (I^q, i^q) \rightarrow (X, x_0)$ be representatives of a and β respectively, then the map $[f, g]_r: (I^{p+q-1}, i^{p+q-1}, 0) \rightarrow (X, A, x_0)$ represents $[a, j^*(\beta)]_r$. Remark that if a mapping $F: (I^{p+q}, 0_*) \rightarrow (X, x_0)$ represents $\gamma \in \pi_{p+q-1}(X)$ and $F(J^{p+q-1}) \subset A$, then $F|I^{p+q-1}: (I^{p+q-1}, i^{p+q-1}, 0_*) \rightarrow (X, A, x_0)$ represents $j^*(\gamma) \in \pi_{p+q-1}(X, A)$. Making use of this remark, we have $[a, j^*(\beta)]_r = j^*(\gamma)$ where γ is represented by a mapping $F: (I^{p+q}, 0_*) \rightarrow (X, x_0)$ such that $F|I^{p+q-1} = [f, g]_r$ and $F|J^{p+q-1} = ([f, g]|I^{p+q-1}) \circ P_n$. Since $[f, g]_r = ([f, g]|J^{p+q-1}) \circ P_n^{-1}$, we have $F = [f, g] \circ \bar{P}_n$ where \bar{P}_n is given by $\bar{P}_n|I_n = P_n$ and $\bar{P}_n|J_n = P_n^{-1}$ and hence \bar{P}_n is a homeomorphism reversing the orientation. Consequently we obtain

$$(2.19) \quad j^*[a, \beta] = -[a, j^*(\beta)]_r \quad \text{for } a \in \pi_p(A) \text{ and } \beta \in \pi_q(X).$$

Similarly we have

$$(2.19)' \quad j^*_0[a, i^*(\beta)]_r = (-1)^q [j^*(a), \beta]_t \quad \text{for } a \in \pi_p(B), \beta \in \pi_q(A, A \cap B)$$

and for the natural homomorphisms $j^*: \pi_p(B) \rightarrow \pi_p(B, A \cap B)$, $i^*: \pi_q(A, A \cap B) \rightarrow$

$\pi_q(X, B)$ and $j_0^*: \pi_{p+q-1}(X; B) \rightarrow \pi_{p+q-1}(X; A, B)$.

Let $\eta: I^p \times I^q \rightarrow I^{p+q}$ be a mapping given by $\eta(x_1, \dots, x_p, y_1, \dots, y_q) = (x_1, \dots, x_{p-1}, y_1, \dots, y_q, x_p)$, then the mapping $(f, g)_t; (K^{p+q-1}; J^{p+q-2}, J_0^{p+q-2}, 0_*) \rightarrow (X; A, B, x_0)$ of (2.15)' satisfies the condition:

(2.20) $(f, g)_t(\eta(I^p \times J^{q-1})) \subset B$, $(f, g)_t(\eta(J^{p-1} \times I^q)) \subset A$, $(f, g)_t(\eta(I^p \times J^{q-1} \cup J^{p-1} \times I^q)) \subset A \cap B$, and $(f, g)_t|_{\eta(I^p \times 0_*)}$ and $(f, g)_t|_{\eta(0^* \times I^q)}$ represent the elements $\alpha \in \pi_p(B, A \cap B)$ and $\beta \in \pi_q(A, A \cap B)$ respectively.

Lemma (2.21) *If a mapping $F: (K^{p+q-1}, J^{p+q-1}, J_0^{p+q-1}, 0_*) \rightarrow (X; A, B, x_0)$ satisfies the condition then the composite map $F \circ P'_{p+q+1}$ represents $[\alpha, \beta]_t$.*

The proof of the lemma follows the fact that $I^p \times 0_* \cup 0_* \times I^q$, $I^p \times J^{q-1} \cup J^{p-1} \times I^q$ and $0_* \times I^q \cup J^{p-1} \times I^q$ are retracts of $I^p \times J^{q-1} \cup J^{p-1} \times I^q$, $I^p \times J^{q-1}$ and $J^{p-1} \times I^q$ respectively.

iii) Join and Hopf construction.

A join $f * g: (I^{p+q+2}, 0_*) \rightarrow (I^{m+n+2}, 0)$ of $f: (I^{p+1}, 0_*) \rightarrow (I^{m+1}, 0_*)$ and $g: (I^{q+1}, 0_*) \rightarrow (I^{n+1}, 0_*)$ is defined by

$$(2.21) \quad (f * g)(\Phi_{p,q}(x, y, t)) = \Phi_{m,n}(f(x), g(y), t).$$

Let $\bar{f}: (I^{p+q}, I^{p+1}) \rightarrow (I^{m+1}, I^{m+1})$ and $\bar{g}: (I^{p+1}, I^{p+1}) \rightarrow (I^{n+1}, I^{n+1})$ be extensions of $f = \bar{f}|_{I^{p+1}}$ and $g = \bar{g}|_{I^{q+1}}$ such that if $f(x_1, \dots, x_{p+1}) = (x'_1, \dots, x'_{m+1})$ and $g(y_1, \dots, y_{q+1}) = (y'_1, \dots, y'_{n+1})$ then $\bar{f}(tx_1, \dots, tx_{p+1}) = (tx'_1, \dots, tx'_{m+1})$ and $\bar{g}(ty'_1, \dots, ty'_{q+1}) = (ty'_1, \dots, ty'_{n+1})$. Define a mapping $\bar{f} \times \bar{g}: (I^{p+q+2}, I^{p+q+2}) \rightarrow (I^{m+n+2}, I^{m+n+2})$ by $(\bar{f} \times \bar{g})(x_1, \dots, x_{p+q+2}) = (f(x_1, \dots, x_{p+1}), g(x_{p+2}, \dots, x_{p+q+2}))$, then we have $\partial \bar{f} = f$, $\partial \bar{g} = g$ and $\partial(\bar{f} \times \bar{g}) = f * g$.

As is shown in [22], the join operator is induced in homotopy groups and is bilinear. Let $\alpha \in \pi_p(S^m)$ and $\beta \in \pi_q(S^n)$ be the classes of $\varepsilon_m \circ f$ and $\varepsilon_n \circ g$ respectively, then $\psi_{m+1} \circ \bar{f}: (I^{p+1}, I^{p+1}) \rightarrow (S^{m+1}, y_*)$ and $\psi_{n+1} \circ \bar{g}: (I^{q+1}, I^{q+1}) \rightarrow (S^{n+1}, y_*)$ represent $E(\alpha)$ and $E(\beta)$ by (2.7). From (2.9) and (1.11) $\phi_{m+1, n+1}((\psi_{m+1} \circ \bar{f}) \times (\psi_{n+1} \circ \bar{g})) = \phi_{m+1, n+1} \circ \psi_{m+1, n+1}(\bar{f} \times \bar{g}) = \psi_{m+n+2}(\bar{f} \times \bar{g}): (I^{p+q+2}, I^{p+q+2}) \rightarrow (S^{m+n+1}, y_*)$, and by (2.7) we have

$$(2.22) \quad \phi_{m+1, n+1}^*(E(\alpha) \times E(\beta)) = E(\alpha * \beta) \quad \alpha \in \pi_p(S^m), \beta \in \pi_q(S^n).$$

Let f, g, \bar{f} and \bar{g} be mappings as above. For two mappings $f': (I^{m+1}, I^{m+1}) \rightarrow (X, x_0)$ and $g': (I^{n+1}, I^{n+1}) \rightarrow (X, x_0)$,

$$(2.23) \quad \begin{aligned} [f', g'] \circ (f * g)(\Phi_{p,q}(x, y, t)) &= [f', g'](\Phi_{m,n}(f(x), g(y), t)) \\ &= f'(\bar{f}((1-t)x_1, \dots, (1-t)x_{p+1})) \quad 0 \leq t \leq 1, \\ &= g'(\bar{g}((1+t)y_1, \dots, (1+t)y_{q+1})) \quad -1 \leq t \leq 0. \\ &= [f' \circ \bar{f}, g' \circ \bar{g}](\Phi_{p,q}(x, y, t)). \end{aligned} \quad \text{Therefore by (2.7) we have}$$

where $\alpha' \in \pi_{m+1}(X)$, $\beta' \in \pi_{n+1}(X)$, $\alpha \in \pi_p(S^m)$ and $\beta \in \pi_q(S^n)$.

The following property of join was provided in [22]

(2.24) $(-)^{(n+1)(r+1)} \iota_n * u = u * \iota_n = E^{n+1}(u)$, where $u \in \pi_n(S^r)$ and $\iota_n \in \pi_n(S^n)$ is represented by the identity map.

A Hopf construction $Gf: (\dot{I}^{p+q+2}, 0_*) \rightarrow (E(X), x_0)$ of $f: (\dot{I}^{p+1} \times \dot{I}^{q+1}, 0_*) \rightarrow (X, x_0)$ is defined by

$$(2.25) \quad Gf(\phi_{p,q}(x, y, t)) = d(f(x, y), t).$$

The mapping Gf satisfies the conditions $Gf(I^{p+1} \times \dot{I}^{q+1}) \subset \hat{X}_+$, $Gf(\dot{I}^{p+1} \times I^{q+1}) \subset \hat{X}_-$ and $Gf|_{\dot{I}^{p+1} \times \dot{I}^{q+1}} = f$, and conversely, any mapping $G^1: (\dot{I}^{p+q+2}, 0_*) \rightarrow (E(X), x_0)$ satisfying the condition is homotopic to Gf .

We say that the map f has a type (α, β) if $f|_{\dot{I}^{p+1} \times 0_*}$ and $f|_{0_* \times \dot{I}^{q+1}}$ represent $\alpha \in \pi_p(X)$ and $\beta \in \pi_q(X)$ respectively. Also a mapping $f': (S^p \times S^q, y_* \times y_*) \rightarrow (X, x_0)$ is said to have a type (α, β) , if $f'|_{S^p \times y_*}$ and $f'|_{y_* \times S^q}$ represent $\alpha \in \pi_p(X)$ and $\beta \in \pi_q(X)$ respectively. Consider the composite map $f' \circ \phi_{p,q}: (\dot{I}^{p+q}, 0_*) \rightarrow (X, x_0)$, then $f' \circ \phi_{p,q}|_{\dot{I}^{p+q}}$ represents $[\alpha, \beta]$ by (2.13), hence $f' \circ \phi_{p,q}$ gives a nullhomotopy of $f' \circ \phi_{p,q}|_{\dot{I}^{p+q}}$ and $[\alpha, \beta] = 0$. Conversely if $[\alpha, \beta] = 0$, there is an apping $F: (I^{p+q}, 0_*) \rightarrow (X, x_0)$ such that $F|_{\dot{I}^{p+q}} = f' \circ \phi_{p,q}|_{\dot{I}^{p+q}}$, $f': (S^p \vee S^q, y_* \times y_*) \rightarrow (X, x_0)$ and $f'|_{S^p \times y_*}$ and $f'|_{y_* \times S^q}$ represent α and β respectively. Define $f'|_{(S^p \times S^q - S^p \vee S^q)}$ by setting $f'(x) = F \circ \psi_{p,q}^-(x)$ for $x \in S^p \times S^q - S^p \vee S^q$, then f' has the type $[\alpha, \beta]$.

(2.26) *There is a mapping $f: \dot{I}^{p+1} \times \dot{I}^{q+1} \rightarrow X$ of type (α, β) if and only if $[\alpha, \beta] = 0$.*

Since \hat{X}_+ and \hat{X}_- are contractible the boundary homomorphisms $\partial_+: \pi_{q+1}(\hat{X}_+, X) \rightarrow \pi_q(X)$ and $\partial_-: \pi_{p+1}(X, \hat{X}_-) \rightarrow \pi_p(X)$ are isomorphisms onto. Let $\bar{\alpha} \in \pi_{p+1}(\hat{X}_-, X)$ and $\bar{\beta} \in \pi_{q+1}(\hat{X}_+, X)$ be elements such that $\partial \bar{\alpha} = \alpha \in \pi_p(X)$ and $\partial \bar{\beta} = \beta \in \pi_q(X)$, then $\mathcal{A}[\bar{\alpha}, \bar{\beta}]_t = \partial[\bar{\alpha}, \bar{\beta}]_r = [\alpha, \beta]$. The exactness of the sequence

$$\cdots \rightarrow \pi_{p+q+1}(E(X)) \xrightarrow{I} \pi_{p+q+1}(E(X); \hat{X}_+, \hat{X}_-) \xrightarrow{\Delta} \pi_{p+q-1}(X) \xrightarrow{E} \pi_{p+q}(E(X)) \rightarrow \cdots$$

leads

$$(2.27) \quad E[\alpha, \beta] = 0 \quad \alpha \in \pi_p(X), \beta \in \pi_q(X).$$

If $[\alpha, \beta] = 0$, then $\mathcal{A}[\bar{\alpha}, \bar{\beta}]_t = 0$ and there is an element γ of $\pi_{p+q+1}(E(X))$ such that $I(\gamma) = [\bar{\alpha}, \bar{\beta}]_t$.

Lemma (2.28) *$I(\gamma) = [\bar{\alpha}, \bar{\beta}]_t$ if and only if $(-1)^{p(q+1)+1} \gamma$ is represented by the Hopf construction of a mapping: $(\dot{I}^{p+1} \times \dot{I}^{q+1}, 0_*) \rightarrow (X, x_0)$ of the type (α, β) .*

First remark that if a mapping $F: (\dot{I}^{n+1}, 0_*) \rightarrow (X, x_0)$ represents $\gamma \in \pi_n(X)$, and if $F(I^n) \subset B$ and $F(I^n) \subset A$, then $(F|_{K^n}) \circ P_n'^{-1}: (I^n; J^{n-1}, I^{n-1}, 0_*) \rightarrow (X; A, B, x_0)$ represents $-I(\gamma)$, where $I: \pi_n(X) \rightarrow \pi_n(X; A, B)$ is the natural homomorphism.

Let $\bar{f}: (I^{p+1}, I^p, J^p) \rightarrow (\hat{X}_-, X, x_0)$ and $\bar{g}: (I^{q+1}, I^q, J^q) \rightarrow (\hat{X}_+, X, x_0)$ be

representatives of \bar{a} and $\bar{\beta}$ respectively. We extend the mapping $(\bar{f}, \bar{g})_t: (K^{p+q+1}; J^{p+q}, J^{p+q}, 0_*) \rightarrow (E(X); X_+, X_-, x_0)$ of (2.14)' over I^{p+q+2} as follows, and obtain a map $F: I^{p+q+2} \rightarrow E(X)$. Since $(\langle \bar{f}, \bar{g} \rangle_t | I^{p+q}) \circ P' = \partial \beta_+ [\bar{f}, \bar{g}]_t = [f, g] \simeq 0$, the mapping $F|I^{p+q} = (f, g)_t | I^{p+q}$ is extendable over I^{p+q} such that $F(I^{p+q}) \subset X$. Since \hat{X}_+ and \hat{X}_- are contractible, the mappings $F|I^{p+q+1}: I^{p+q+1} \rightarrow \hat{X}_+$ and $F|I_{p+q+1}^{p+q+1}: I_{p+q+1}^{p+q+1} \rightarrow \hat{X}_-$ are extendable over I^{p+q+1} and I_{p+q+1}^{p+q+1} such that $F(I^{p+q+1}) \subset \hat{X}_+$ and $F(I_{p+q+1}^{p+q+1}) \subset X_-$. Let $\eta: I^{p+q+2} \rightarrow I^{p+q+2}$ be a mapping of degree $(-1)^{p(q+1)}$ given by $\eta(x_1, \dots, x_{p+q+2}) = (x_{p+1}, \dots, x_{p+q+1}, x_1, \dots, x_p, x_{p+q+2})$. Then the composite map $F \circ \eta: I^{p+q+2} \rightarrow E(X)$ maps subsets $I^{p+1} \times I^{q+1}$ and $I^{p+1} \times I^{q+1}$ into \hat{X}_+ and \hat{X}_- respectively, and therefore $F \circ \eta$ is homotopic to the Hopf construction of the mapping $F \circ \eta | I^{p+1} \times I^{q+1}$ which has type (α, β) . By making use of the above remark, the necessity of the lemma is established.

Conversely, let $F': I^{p+q+2} \rightarrow X$ be the Hopf construction of $F' | I^{p+1} \times I^{q+1}$, then $F' \circ \eta$ maps I^{p+q+1} and I_{p+q+1}^{p+q+1} into \hat{X}_+ and \hat{X}_- respectively, and therefore $(F' \circ \eta | K^{p+q+1}) \circ P'_{p+q+1}$ represents $(-1)I(\{F'\})$. While $F' \circ \eta | K^{p+q+1}$ satisfies the condition (2.20) and homotopic to $(\bar{f}, \bar{g})_t$, and the sufficiency of the lemma is established.

Define a suspension $E'f: (I^{n+1}, I^n, J^n) \rightarrow (E(X), E(A), x_0)$ of $f: (I^n, I^{n-1}, J^{n-1}) \rightarrow (X, A, x_0)$ by

$$(2.29) \quad E'f(x_1, \dots, x_{n+1}) = d(f(x_1, \dots, x_{n-1}, x_{n+1}), 2x_n - 1).$$

Clearly $f \simeq f'$ implies $E'f \simeq E'f'$, and $E'(f + {}_i g) = E'f + {}_i E'g$ ($1 \leq i \leq n-1$), and we obtain a suspension homomorphism $E': \pi_n(X, A) \rightarrow \pi_n(E(X), E(A))$. Also we have $\partial(E'f) = E(\partial f)$ and $E(\alpha) = -E'(j^*(\alpha))$ for $\alpha \in \pi_n(X)$.

Now we shall prove the fact analogous to (2.27):

$$(2.30) \quad E'[\alpha, \beta]_r = 0 \quad \text{for } \alpha \in \pi_n(A) \text{ and } \beta \in \pi_q(X, A).$$

Set $J_+^n = \{x \in J^n | x_n \geq 1/2\}$, $J_-^n = \{x \in J^n | x_n \leq 1/2\}$, $I_+^n = I^n \cap J_+^n$, and $I_-^n = I^n \cap J_-^n$. First remark that if a mapping $F: J^{n+1} \rightarrow E(X)$ satisfies condition

$$(2.31) \quad F(J_+^{n+1}) \subset \hat{X}_+, F(J_-^{n+1}) \subset \hat{X}_-, F(I_+^n) \subset \hat{A}_+, F(I_-^n) \subset \hat{A}_-, \text{ and if } F_0: J^n \rightarrow X \text{ is a mapping given by } F_0(x_1, \dots, x_{n+1}) = F(x_1, \dots, x_n, 1/2, x_{n+1}), \text{ and } F_0 \circ P_n \text{ represents } \alpha \in \pi_n(X, A), \text{ then } F \circ P_{n+1} \text{ represents } E'(\alpha).$$

Define subsets of I^{n+1} by $L^n = Cl(I^{n+1} - I_{n-1}^n - I_n^{n-n})$, $K_1^{n-1} = Cl(I_n^n - I_{n-1}^{n-1} - I^n)$, $K_2^{n-1} = Cl(I_{n-1}^n - I_n^n - I^n)$, $J_1^{n-2} = K_1^{n-1} \cap K_1^{n-1}$ and $J_2^{n-2} = K_1^{n-1} \cap K_2^{n-1}$, then L^n is a closed cell with faces K_1^{n-1} , K_2^{n-1} and K^{n-1} . There is a homeomorphism $\chi: (J^{p+q}; J_+^{p+q}, J_-^{p+q}, I_+^{p+q}, I_-^{p+q}) \rightarrow (K_1^{p+q} \cup K_2^{p+q}; K_1^{p+q}, K_2^{p+q}, J_1^{p+q-1}, J_2^{p+q-1})$ and a mapping $\bar{\chi}: J^{p+q} \times I^1 \rightarrow L^{p+q+1}$ such that $\chi(x_1, \dots, x_{p+q-1}, 1/2, x_{p+q-1}) = (x_1, \dots, x_{p+q}, 0)$, $\bar{\chi}(x, 0) = \chi(x)$ for $x \in J^{p+q}$, $\bar{\chi}(x, t) = \chi(x)$ for $x \in I^{p+q}$, and $\bar{\chi} | \text{Int. } J^{p+q} \times I^1$ is a homeomorphism.

Let $f: (I^p, I^p) \rightarrow (A, x_0)$ and $g: (I^q, I^{q-1}, J^{q-1}) \rightarrow (X, A, x_0)$ be represent-

atives of $\alpha \in \pi_p(A)$ and $\beta \in \pi_q(X, A)$ respectively, and define mappings $\tilde{f}: (I^{p+1}, I^p, J^p) \rightarrow (\hat{A}_+, A, x_0)$ and $\tilde{g}: (I^{q+1}; I^q, I_0^q, K^q) \rightarrow (\hat{X}_-, X, \hat{A}_-, x_0)$ by setting $\tilde{f}(x_1, \dots, x_{p+1}) = d(f(x_1, \dots, x_p), 2x_{p+1} - 1)$ and $\tilde{g}(x_1, \dots, x_{q+1}) = d(g(x_1, \dots, x_{q-1}, x_{q+1}), 2x_q - 1)$. Define a mapping $F: L^{p+q+1} \rightarrow E(X)$ by

$$\begin{aligned} \bar{F}(x_1, \dots, x_{p+q+2}) &= \tilde{f}(x_1, \dots, x_p, x_{p+q+1}) \quad \text{if } (x_{p+1}, \dots, x_{p+q}, x_{p+q+2}) \in K^q, \\ &= \tilde{g}(x_{p+1}, \dots, x_{p+q}, x_{p+q+2}) \quad \text{if } (x_1, \dots, x_{p+1}, x_{p+q+1}) \in J^p. \end{aligned}$$

The map $F = (\bar{F}|K_1^{p+q} \cup K_2^{p+q}) \circ \chi$ satisfies the condition (2.31) and therefore $F \circ P_{p+q}$ represents $E'[\alpha, \beta]_r$.

By setting $F'_t(x) = \bar{F}(\chi(x, t))$ and $F_t = F'_t \circ P_{p+q}$ we see that $F = F_0$ is homotopic to F_1 which maps J^{p+q} into $E(A)$ and is homotopic to the trivial map, and the proof of (2.30) is established.

Supposed that elements $\alpha \in \pi_p(A)$ and $\beta \in \pi_q(X, A)$ satisfies the condition $[\alpha, \partial\beta] = 0$. Consider the following diagram

$$\begin{array}{ccccc} \pi_{p+q-1}(X) & \xrightarrow{j'} & \pi_{p+q-1}(X, A) & \xrightarrow{\partial} & \pi_{p+q-2}(A) \\ & \downarrow E & & \downarrow E' & \\ \pi_{p+q}(E(A)) & \xrightarrow{i^*} & \pi_{p+q}(E(X)) & \xrightarrow{j} & \pi_{p+q}(E(X), E(A)) \end{array}$$

The condition $\partial[\alpha, \beta]_r = [\alpha, \partial\beta] = 0$ implies that there is an element γ of $\pi_{p+q-1}(X)$ such that $j'(\gamma) = [\alpha, \beta]_r$. Since $j(E(\gamma)) = -E'(j'(\gamma)) = -E'[\alpha, \beta]_r = 0$ by (2.30), there is an element δ of $\pi_{p+q}(E(A))$ such that $i^*(\delta) = E(\gamma)$.

Lemma (2.32) *With the above hypothesis, $(-1)^{p(q+1)} \delta$ is represented by the Hopf construction of a mapping of type $(\alpha, \partial\beta)$, and conversity is also true.*

As in the proof of (2.19) $-\gamma$ is represented by a mapping $G: (I^{p+q}, 0_*) \rightarrow (X, x_0)$ such that $G|J^{p+q-1} = (f, g)_r$, where f and g are representatives of α and β respectively. Also $E(\gamma)$ is represented by a mapping $F': (I^{p+q+1}, 0_*) \rightarrow (E(X), x_0)$ such that $F'|J^{p+q} = F$, $F'(I_+^{p+q}) \subset \hat{A}_+$ and $F'(I_-^{p+q}) \subset \hat{A}_-$. $\chi_1(x) = \tilde{\chi}(x, 1)$ gives a homeomorphism $\chi_1: (J^{p+q}; I_+^{p+q}, I_-^{p+q}) \rightarrow (K^{p+q}; J^{p+q-1}, J^{p+q-1})$, and there is a homeomorphism $\omega: I^{p+q+1} \rightarrow I^{p+q+1}$ such that $\omega(I_+^{p+q}) = I_+^{p+q}$, $\omega(I_-^{p+q}) = I_-^{p+q}$ and $\omega|K^{p+q} = \chi_1^{-1}$. It is not so difficult to show that the map ω has degree (-1) . Therefore we have that the composite map, $F' \circ \omega: I^{p+q+1} \rightarrow E(A)$ represents $(-1)\gamma$ hence represents $(-1)\delta$, and that $F \circ \omega(I^{p+q}) \subset A_+$, $F \circ \omega(I_{p+q}^{p+q}) \subset A_-$ and $F \circ \omega|K^{p+q} = (\tilde{f}, g)_t$. As in the proof of the lemma (2.28) $F \circ \omega$ represents $(-1)^{p(q+1)+1} \gamma' \in \pi_{p+q}(E(A))$, where γ' is represented by the Hopf construction of mapping of type $(\alpha, \partial\beta)$. And the proof of conversity follows from the exactness in the above diagram.

iv) J-homomorphism

Denote the group of the rotations of n -sphere by R_n , and denote the identity by $r_0 \in R_n$. Let $f: (I^{p+1}, 0_*) \rightarrow (R_n, r_0)$ be a representative of $\alpha \in \pi_p(R_n)$, and $\tilde{f}: (I^{p+1} \times I^{n+1}, 0_*) \rightarrow (S^n, y_*)$ be a mapping defined by $\tilde{f}(x, y) = f(x)(\varepsilon_n(y))$. The

homotopy class of the Hopf construction of \tilde{f} is denoted by $J(\alpha) \in \pi_{p+n+1}(S^{n+1})$, which was given by G.W. Whitehead [20] and he showed that the operation J induces homomorphism

$$J: \pi_p(R^n) \rightarrow \pi_{p+n+1}(S^{n+1}).$$

The projection $\kappa: R_n \rightarrow S^n$ given by $\kappa(x) = x(y_*)$ is the fibre map with the fibre R_{n-1} , so that κ induces isomorphism $\kappa^*: \pi_p(R_n, R_{n-1}) \rightarrow \pi_p(S^n)$. Let $\iota_n \in \pi_n(S^n)$ be the element represented by $\psi_n: (I^n, \dot{I}^n) \rightarrow (S^n, y_*)$. Define a homomorphism $K: \pi_p(R_n, R_{n-1}) \rightarrow \pi_{p+n+1}(S^{n+1}; E_+^{n+1}, E_-^{n+1})$ by setting ($p \geq 2$)

$$(2.33) \quad K(\alpha) = [\partial_-^{-1}(\kappa^*(\alpha)), \partial_+^{-1} \iota_n]_t \quad \text{for } \alpha \in \pi_p(R_n, R_{n-1}),$$

where $\partial_-: \pi_{p+1}(E_-^{n+1}, S^n) \rightarrow \pi_p(S^n)$ and $\partial_+: \pi_{p+1}(E_+^{n+1}, S^n) \rightarrow \pi_p(S^n)$ are boundary homomorphisms (isomorphisms).

Lemma (2.34) *In the diagram*

$$\begin{array}{ccccccc} \cdots \rightarrow \pi_p(R_{n-1}) & \xrightarrow{i^*} & \pi_p(R_n) & \xrightarrow{j^*} & \pi_p(R_n, R_{n-1}) & \xrightarrow{\partial} & \pi_{p-1}(R_{n-1}) \rightarrow \cdots \\ & \downarrow J & \downarrow J & \downarrow J & \downarrow K & \Delta & \downarrow J \\ \cdots \rightarrow \pi_{p+n}(S^n) & \xrightarrow{E} & \pi_{p+n+1}(S^{n+1}) & \xrightarrow{I} & \pi_{p+n+1}(S^{n+1}; E_+^{n+1}, E_-^{n+1}) & \xrightarrow{\Delta} & \pi_{p+n+1}(S^n) \rightarrow \cdots \end{array}$$

relations $E \circ J = -J \circ i^*$, $I \circ J = (-1)^{p+n+1} K \circ j^*$ and $\Delta \circ K = (-1)^{p+1} J \circ \partial$ hold.

The first relation was proved in previous paper [18], and the second relation follows from (2.28). To show the third relation we realize the operation K . Let $f: (J^p, \dot{I}^p) \rightarrow (R_n, R_{n-1})$ be a mapping such that $f \circ P_p$ is a representative of $\alpha \in \pi_p(R_n, R_{n-1})$, and let $\tilde{f}: J^p \times \dot{I}^{n+1} \rightarrow S^n$ be a mapping given by $f(x, y) = f(x)(\varepsilon_n(y))$. Since the element of R_{n-1} is regarded as the element of R_n , which maps hemispheres E_+^n and E_-^n to E_+^n and E_-^n respectively, and coincide to R_{n-1} on S^{n-1} , \tilde{f} maps $J^p \times \dot{I}_+^{n+1}$ and $\dot{I}^p \times \dot{I}_-^{n+1}$ to E_+^n and E_-^n respectively. A mapping $F: (K^{p+n+1}; J^{p+n}, J_0^{p+n}, 0_*) \rightarrow (S^{n+1}; E_+^{n+1}, E_-^{n+1}, y_*)$ is defined on $J^p \times I^n$ by setting $F|J^p \times \dot{I}^{n+1} = \tilde{f}$, by extending $F|I^p \times J^n$ over $I^p \times J^n$ such that $F(I^p \times J^n) \subset E_-^{n+1}$, and elsewhere satisfying the condition (2.20). Then $F \circ P'_{p+n+1}$ represents $[\partial_-^{-1} \kappa^*(\alpha), \partial_+^{-1} \beta]_t = K(\alpha)$. Since $F \circ P'_{p+n+1}|I^{p+n}: (I^{p+n}, 0_*) \rightarrow (S^n, y_*)$ maps $I^p \times \dot{I}^n$ and $\dot{I}^p \times I^n$ into E_-^{n+1} and E_+^{n+1} respectively, and $F(x, y) = f(x)(\varepsilon_{n-1}(y))$ for $(x, y) \in \dot{I}^p \times \dot{I}^n$, we have from (2.25) that $F|I^{p+n} = F \circ P'_{p+n}|I^{p+n}$ represents $J(\partial(\alpha))$, hence we have $\Delta \circ K(\alpha) = (-1)^{p+n} J(\partial(\alpha))$.

Chapter 3. A generalization of Hopf and Freudenthal Invariants.

i) Denote a subspace $A \times b_0 \cup a_0 \times B$ of $A \times B$ by $A \vee B$, and let $i_1: A \rightarrow A \vee B$, $i_2: B \rightarrow A \vee B$, $p_1: A \times B \rightarrow A$, and $p_2: A \times B \rightarrow B$ be mappings given by $i_1(a) = (a, b_0)$, $i_2(b) = (a_0, b)$, $p_1(a, b) = a$ and $p_2(a, b) = b$ respectively. It was shown by G.W. Whitehead [22] that the injection homomorphisms $i_1^*: \pi_n(A) \rightarrow \pi_n(A \vee B)$ and $i_2^*: \pi_n(B) \rightarrow \pi_n(A \vee B)$ and the boundary homomorphism $\partial: \pi_{n+1}(A \times B, A \vee B) \rightarrow \pi_n(A \vee B)$ are isomorphisms into, and that there is a direct sum decomposition ($n \geq 1$).

$$\pi_n(A \vee B) = i_1^* \pi_n(A) + i_2^* \pi_n(B) + \partial \pi_{n+1}(A \times B, A \vee B)$$

with projections to these direct factors $p_1^*: \pi_n(A \vee B) \rightarrow \pi_n(A)$, $p_2^*: \pi_n(A \vee B) \rightarrow \pi_n(B)$ and $Q_0: \pi_n(A \vee B) \rightarrow \pi_{n+1}(A \times B, A \vee B)$. For $a \in \pi_n(A \vee B)$, we have $a = i_1^* p_1^*(a) + i_2^* p_2^*(a) + \partial Q_0(a)$.

From the exactness of the following two sequences

$$\cdots \rightarrow \pi_n(B) \xrightarrow{i_2^*} \pi_n(A \vee B) \xrightarrow{j} \pi_n(A \vee B, B) \longrightarrow \pi_{n+1}(B) \longrightarrow \pi_{n-1}(A \vee B) \rightarrow \cdots$$

and

$$\cdots \rightarrow \pi_n(A) \xrightarrow{i \circ i_1^*} \pi_n(A \vee B, B) \xrightarrow{j'} \pi_n(A \vee B; A, B) \rightarrow \pi_n(A) \rightarrow \pi_n(A \vee B, B) \rightarrow \cdots$$

we see that the composition $j' \circ j \circ \partial: \pi_{n+1}(A \times B, A \vee B) \rightarrow \pi_n(A \vee B; A, B)$ is isomorphism onto for $n \geq 3$. Define a isomorphism

$$(3.1) \quad Q: \pi_n(A \vee B; A, B) \rightarrow \pi_{n+1}(A \times B, A \vee B)$$

by setting $Q = (j' \circ j \circ \partial)^{-1}$, then $Q_0 = Q \circ j' \circ j$.

Set $S_1^r = S^r \times y_*$, $S_2^r = y_* \times S^r$ and $y_0 = y_* \times y_*$, and consider the following diagram, in which the commutativity relations hold;

$$\begin{array}{ccccccc} \cdots \rightarrow \pi_{n-1}(S^{r-1}) & \xrightarrow{E} & \pi_n(S^r) & \xrightarrow{I} & \pi_n(S^r; E_+^r, E_-^r) & \xrightarrow{\Delta} & \pi_{n-2}(S^{r-1}) \rightarrow \cdots \\ & \downarrow \varphi_r^* & & & \downarrow \varphi_r^* & & \\ & \pi_n(S_1^r \vee S_2^r) & \xrightarrow{I'} & \pi_n(S_1^r \vee S_2^r; S_1^r, S_2^r) & & & \\ & \searrow Q_0 & & \downarrow Q & \nearrow \phi_{r,r}^* & & \\ & \pi_{n+1}(S_1^r \times S_2^r, S_1^r \vee S_2^r) & & \pi_{n+1}(S^{2r}) & & & \\ & & \uparrow \psi_{r,r}^* & \uparrow \partial' & \uparrow E & & \\ & & \pi_{n+1}(I^{2r}, I^{2r}) & \longrightarrow & \pi_n(S^{2r-1}), & & \end{array}$$

then our *Hopf homomorphisms* $H: \pi_n(S^r, E_+^r, E_-^r) \rightarrow \pi_{n+1}(S^{2r})$ and $H_0: \pi_n(S^r) \rightarrow \pi_{n+1}(S^{2r})$ are defined by setting ($n \geq 3$)

$$(3.2) \quad H = \phi_{r,r}^* \circ Q \circ \varphi_r^* \text{ and } H_0 = H \circ I.$$

The generalized Hopf homomorphism $H': \pi_n(S^r) \rightarrow \pi_n(S^{2r-1})$ of G. W. Whitehead [22] [23] are given by $H' = \partial' \circ \psi_{r,r}^{*-1} \circ Q_0 \circ \varphi_r^*$ for $n \leq 4r-4$, and from the commutativity of the above diagram we have $H_0 = H' \circ E$. Since E is isomorphic for $n \leq 4r-4$, we have that H' is *equivalent* to H_0 .

As is shown in [9] and [18], we have

$$(3.3) \quad H_0 \circ E = 0,$$

$$(3.4) \quad H_0(\beta \circ E(a)) = H_0(\beta) \circ EE(a).$$

Theorem (3.5) *If $a \in \pi_p(E_-^r, S^{r-1})$, $\beta \in \pi_q(E_+^r, S^{r-1})$, then*

$$H[a, \beta]_t = (-1)^{q+1} E((\partial a) * (\partial \beta)).$$

Proof. Let $f_0: (I^{q-1}, I^{q-1}) \rightarrow (S^{r-1}, y_*)$ be a representative of $\partial \beta \in \pi_{q-1}(S^{r-1})$, then β is represented by $f(x_1, \dots, x_q) = d_{r-1}(f_0(x_1, \dots, x_{q-1}), x_q)$. By (1.7), $\varphi_r(f(x)) = (Ef_0(x), y_*)$, and we have $\varphi_r^*(\beta) = i_1^* E(\partial \beta)$. Similarly we have

$\varphi_r^*(u) = i_2^* E(\partial u)$. By (3.2), (3.1), (2.12), (2.19) and (2.22) we have

$$\begin{aligned} H[u, \beta]_t &= \phi_{r,r}^* \circ Q \circ \varphi_r^*[u, \beta]_t = \phi_{r,r}^* \circ Q[i_2^* E(\partial u), i_1^* E(\partial \beta)]_t \\ &= (-1)^{q+1} \phi_{r,r}^*(j' \circ j \circ \partial) \circ (j' \circ j \circ \partial)(E(\partial u) \times E(\partial \beta)) \\ &= (-1)^{q+1} \phi_{r,r}^*(E(\partial u)) = (-1)^{q+1} E((\partial u) * (\partial \beta)). \end{aligned}$$

Combining this theorem to lemma (2.28) we have

Corollary (3.6) *If $\gamma \in \pi_{p+q-1}(S^r)$ is represented by the Hopf construction of a mapping: $I^p \times I^q \rightarrow S^{r-1}$ of type (α, β) ($\alpha \in \pi_{p-1}(S^{r-1})$, $\beta \in \pi_{q-1}(S^{r-1})$), then $H_0(\gamma) = (-1)^{pq} E(\alpha * \beta)$.*

ii) Generalized Freudenthal invariants A', A'' of G.W. Whitehead are defined on the group π_r^n which is isomorphic to $\pi_n(S^r; E_+^r, E_-^r)$, and have the properties $A'(\alpha) = (-1)^r A''(\alpha)$ and $A'(\alpha) - A''(\alpha) = (-1)^{r+1} EEH_0(A(\alpha))$. The following theorem due to G. Takeuchi shows that our Hopf invariant H may be used in place of A' .

Theorem (3.7) $H(\alpha) - (-1)^r \iota_{2r} \circ H(\alpha) = (-1)^{r+1} EEH_0(A(\alpha))$ for $\alpha \in \pi_n(S^r; E_+^r, E_-^r)$ ($n \geq 5, r \geq 2$).

To prove the theorem we need several preparations. Let a homomorphism $A: \pi_{n-1}(S_1^{r-1} \times S_2^{r-1}, S_1^{r-1} \vee S_1^{r-1}) \rightarrow \pi_{n+1}(S_1^r \times S_2^r, S_1^r \vee S_2^r)$ be induced by the formula $Af(x_1, \dots, x_{n+1}) = (d_{r-1}(p_1 f(x_1, \dots, x_{n-2}, x_{n+1}), 2x_{n-1} - 1), d_{r-1}(p_2 f(x_1, \dots, x_{n-2}, x_{n+1}), 2x_n - 1))$ where $f: (I^{n-1}, I^{n-2}, J^{n-2}) \rightarrow (S_1^{r-1} \times S_2^{r-1}, S_1^{r-1} \vee S_2^{r-1}, y_0)$ is a mapping. As is shown by Hilton [9], in the diagram

$$\begin{array}{ccccc} \pi_{n-1}(S_1^{r-1} \times S_2^{r-1}, S_1^{r-1} \vee S_2^{r-1}) & \xrightarrow{A} & \pi_{n+1}(S_1^r \times S_2^r, S_1^r \vee S_2^r) & \xleftarrow[Q_0]{\partial} & \pi_n(S_1^r \vee S_2^r) \\ \downarrow \phi_{r-1, r-1}^* & & \downarrow \phi_{r, r}^* & & \downarrow \sigma_r^* \\ \pi_{n-1}(S^{2r-2}) & \xrightarrow{E \circ E} & \pi_{n+1}(S^{2r}) & & \pi_{n+1}(S_1^r \times S_2^r, S_1^r \vee S_2^r) \end{array}$$

the relations $\phi_{r,r}^* \circ A = (-1)^r EE \circ \phi_{r-1, r-1}^*$, $\phi_{r,r}^* \circ \sigma_r^* = (-1)^r \iota_{2r} \circ \phi_{r,r}^*$ and $\sigma_r^* \circ Q_0 = Q_0 \circ \sigma_r^*$ hold. The restriction $F = Af|I^n$ satisfies condition

$$(3.8) \quad \begin{aligned} F(x_1, \dots, x_n) \in & S_1^r \vee E_+^r \quad \text{if } x_{n-1} \leq x_n \text{ and } x_{n-1} \geq 1 - x_n, \\ & S_1^r \vee E_-^r \quad \text{if } x_{n-1} \geq x_n \text{ and } x_{n-1} \leq 1 - x_n, \\ & E_+^r \vee S_2^r \quad \text{if } x_{n-1} \geq x_n \text{ and } x_{n-1} \geq 1 - x_n, \\ & E_-^r \vee S_2^r \quad \text{if } x_{n-1} \leq x_n \text{ and } x_{n-1} \leq 1 - x_n, \end{aligned}$$

and $F(x_1, \dots, x_{n-1}, 1/2, 1/2, 0) = \partial f(x_1, \dots, x_{n-2})$.

If a mapping $F: I^{n+1} \rightarrow S_1^r \vee S_2^r$ satisfies the condition (3.8), the mapping $\partial f: (I^{n-2}, I^{n-2}) \rightarrow (S_1^{r-1} \vee S_2^{r-1}, y_0)$ represents an element α_0 of $\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})$.

Since $F(x_1, \dots, x_{n-1}, 0, 0) = (E(p_1 \circ \partial f)(x_1, \dots, x_{n-1}), y_0)$, the restriction $F|I^n: I^n \rightarrow S_1^r$ represents a nullhomotopy of $E(p_1 \circ f)$, and we have $E(p_1^* \alpha_0) = 0$. Similarly we have $E(p_2^* \alpha_0) = 0$. Conversely for any mapping $f: (I^{n-2}, I^{n-2}) \rightarrow (S_1^{r-1} \vee S_2^{r-1}, y_0)$ which satisfies the condition $E(p_1 \circ f) \simeq 0$ and $E(p_2 \circ f) \simeq 0$,

there is a mapping $F: I^{r+1} \rightarrow S_1^r \vee S_2^r$ which satisfies the condition (3.8).

Since $S_1^{r-1} \vee S_2^{r-1}$ is contractible in $E_+^r \vee E_-^r$, we have that if two mappings $f, g: (I^{n-1}, I^{n-1}) \rightarrow (E_+^r \vee E_-^r, S^{r-1} \vee S^{r-1})$ coincide on I^{n-1} , then f is homotopic to g rel. I^{n-1} . This shows that if two mappings F and F' satisfy the condition (3.8) and homotopic on $I^{n-1} \times (1/2) \times (1/2)$, then F' is homotopic to a mapping F'' (in the homotopy the condition (3.8) holds) such that $F''(x_1, \dots, x_n, 0) = F(x_1, \dots, x_n, 0)$ if $x_{n-1} = x_n$ or $x_{n-1} = 1 - x_n$. It is not so difficult to show that the difference $\{F\} - \{F'\}$ is the sum of four elements, which are represented by mappings of forms: $I^{n+1} \rightarrow E_+^r \vee S_2^r, E_-^r \vee S_2^r, S_1^r \vee E_+^r$ and $S_1^r \vee E_-^r$ respectively. Since E_+^r and E_-^r are contractible, $\{F\} - \{F'\}$ is in $i_1^* \pi_n(S^r) + i_2^* \pi_n(S^r) \subset \pi_n(S_1^r \vee S_2^r)$ and therefore $Q_0\{F\} - Q_0\{F'\} = Q_0(\{F\} - \{F'\}) = 0$. And further calculation shows that the correspondence $\{f\} \rightarrow Q_0\{F\}$ induces a homomorphism

$$\bar{A}: [\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})] \rightarrow \pi_{n+1}(S_1^{r-1} \times S_2^{r-1}, S_1^{r-1} \vee S_2^{r-1})$$

where $[\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})]$ is a subgroup of $\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})$ whose elements satisfy the conditions $E(p_1^* u) = 0$ and $E(p_2^* u) = 0$.

If $g: (I^{n-2}, I^{n-2}) \rightarrow (S^{r-1}, y_*)$ is a mapping such that $E(\{g\}) = 0$, and let g_t be a nullhomotopy of $g_0 = E g$, we define a mapping $G: I^{n+1} \rightarrow S^r$ by $G(x_1, \dots, x_n, 0) = E g(x_1, \dots, x_{n-1})$, $G(x_1, \dots, x_{n-1}, \pm 1, t) = g_t(x_1, \dots, x_{n-1})$ and $G(I^{n-2} \times I^1 \times I^2) = y_0$, then $i_1 \circ G$ satisfies the condition (3.8). Therefore if $u \in i_1^* \pi_{n-2}(S^{r-1}) \cap [\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})]$, then we have $\bar{A}(u) = Q_0 i_1^* \{G\} = 0$. Similarly if $u \in i_2^* \pi_{n-2}(S^{r-1}) \cap [\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})]$, we have $\bar{A}(u) = 0$. If $u \in \pi_{n-1}(S_1^{r-1} \times S_2^{r-1}, S_1^{r-1} \vee S_2^{r-1})$, we have obviously $\bar{A}(\partial u) = A(u)$, hence if $u \in [\pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})]$ we have $\bar{A}(u) = \bar{A}(i_1^* p_1^*(u) + i_2^* p_2^*(u) + \partial Q_0(u)) = A(Q_0(u))$. Consequently we have

Lemma (3.9) *if a mapping F satisfies the condition (3.8), and if $F|I^{n-2} \times (1/2) \times (1/2)$ represents $u \in \pi_{n-2}(S_1^{r-1} \vee S_2^{r-1})$, then we have $Q_0\{F\} = A \circ Q_0(u)$.*

Proof of theorem (3.7). Let $f: (I^n; I_+^{n-1}, I_-^{n-1}, J^{n-1}) \rightarrow (S_1^r; E_+^r, E_-^r, y_*)$ be a representative of $u \in \pi_n(S^r; E_+^r, E_-^r)$, and let $\Delta f: (I^{n-2}, I^{n-2}) \rightarrow (S^r, y_*)$ be representative of Δu such that $\Delta f(x_1, \dots, x_{n-2}) = f(x_1, \dots, x_{n-2}, 1/2, 0)$. Since $f|I^{n-1}$ is homotopic to $E \Delta f$, we may assume that $f|I^{n-1} = E \Delta f$. Set $F = \varphi_r \circ f$ and define a mapping $F': (I^n; I_+^{n-1}, I_-^{n-1}, J^{n-1}) \rightarrow (S_1^r \vee S_2^r; S_2^r, S_1^r, y_0)$ by setting

$$\begin{aligned} F'(x_1, \dots, x_n) &= F(x_1, \dots, x_{n-1}, 2x_n - 1) & 1/2 \leq x_n \leq 1, \\ &= \varphi_r \circ \rho_r(2\pi x_n) E \Delta f(x_1, \dots, x_{n-1}) & 0 \leq x_n \leq 1/2. \end{aligned}$$

It is easily verified that F' is homotopic to a mapping $\varphi_r \circ \rho_r(\pi) \circ F = \sigma_r \circ \varphi_r \circ F$. Since the homomorphism $I': \pi_n(S_1^r \vee S_2^r) \rightarrow \pi_n(S_1^r \vee S_2^r; S_1^r, S_2^r)$ is onto there is a mapping $\bar{F}: I^{n+1} \rightarrow S_1^r \vee S_2^r$ such that $\bar{F}|I^n = F$, $\bar{F}(I_+^{n-1} \times (0) \times I^1) \subset S_1^r$, $\bar{F}(I_-^{n-1} \times (0) \times I^1) \subset S_2^r$, and $\bar{F}(K^r) = y_0$, and we have $I'\{\bar{F}\} = \varphi_r^*(u)$. And also there is a mapping $\bar{F}': I^{n+1} \rightarrow S_1^r \vee S_2^r$ such that $\bar{F}'|I^n = F'$, $\bar{F}'(I_+^{n-1} \times (0) \times I^1) \subset S_2^r$, $\bar{F}'(I_-^{n-1} \times (0) \times I^1) \subset S_1^r$, $\bar{F}'(K^r) = y_0$ and $I'(\{\bar{F}'\}) = \sigma_r^* \circ \varphi_r^*(u)$. The difference $\{\bar{F}\} - \{\bar{F}'\}$ is

represented by a mapping $F_0: I^{n+1} \rightarrow S_1^r \vee S_2^r$ such that $F_0(I^n \times (1) \cup I^{n-1} \times I^2) = y_0$, $F_0(I_+^{n-1} \times (0) \times I^1 \cup I_+^{n-1} \times (1) \times I^1) \subset S_1^r$, $F_0(I_+^{n-1} \times (0) \times I^1 \cup I_+^{n-1} \times (1) \times I^1) \subset S_2^r$ and $F_0(x_1, \dots, x_n) = \varphi_r \circ \rho_r(-\pi x_n) \circ Edf(x_1, \dots, x_{n-1})$.

Define a mapping $\omega: I^{n+1} \rightarrow I^{n+1}$ of degree -1 by setting $\omega((x_1, \dots, x_{n+1})) = (x_1, \dots, x_{n-2}, \omega'(x_{n-1}, x_n), x_{n+1})$ where $\omega'(x, y) = (1 - 2(1-x)(1-y), 1 - 2(1-x)y)$ for $1/2 \leq x \leq 1$ and $\omega'(x, y) = (2xy, 2x(1-y))$ for $0 \leq x \leq 1/2$. Since ω is homeomorphic on $I^{n+1} - I^{n-2} \times I^1 \times I^2$ and F_0 maps $I^{n-1} \times I^1 \times I^2$ into the single point y_0 , there is a mapping $\bar{F}_0: I^{n+1} \rightarrow S_1^r \vee S_2^r$ such that $\bar{F}_0 \circ \omega = F_0$. It is verified from (1.4)' and (1.7) that \bar{F}_0 satisfies the conditions (3.8), and from (3.9) we have

$$\begin{aligned} H(u) - (-1)^r \iota_{2r} \circ H(u) &= \phi_{r,r}^* \circ \sigma_r^* \circ Q \circ \varphi_r^*(u) \\ &= \phi^* \circ Q \circ I' \{ \bar{F} \} - \phi^* \circ Q \circ I' \{ \bar{F}' \} = \phi^* \circ Q \circ (\{ F \} - \{ \bar{F} \}) \\ &= \phi^* \circ Q \circ \{ \bar{F}_0 \} = -\phi^* \circ Q \{ F_0 \} = -\phi^* \circ A \circ Q \circ \left\{ \varphi_r^* \circ \rho_r \left(\frac{\pi}{2} \right) \circ df \right\} \\ &= -\phi^* \circ A \circ Q \circ \varphi_{r-1}^*(\Delta u) = (-1)^{r+1} EEH_0(\Delta u), \end{aligned}$$

and the proof of the theorem (3.9) is accomplished.

Since $\Delta \circ I = 0$, we have

Corollary (3.10) $H_0(u) = (-1)^r \iota_{2r} \circ H_0(u).$

If $u \in \pi_p(S^r)$ and $\beta \in \pi_q(S^r)$, there are elements $\bar{u} \in \pi_{p+1}(E^{r+1}, S^r)$ and $\bar{\beta} \in \pi_{q+1}(E^{r+1}, S^r)$ such that $\partial \bar{u} = u$, $\partial \bar{\beta} = \beta$ and $\Delta[\bar{u}, \bar{\beta}]_t = [u, \beta]$. By (3.5), (3.7) and (2.4), we have $(-1)^r EEH_0[u, \beta] = H[\bar{u}, \bar{\beta}]_t - (-1)^{r+1} \iota_{2r+2} \circ H[\bar{u}, \bar{\beta}]_t = (-1)^q E(u * \beta) - (-1)^{r+1} \iota_{r+2} \circ (-1)^q E(u * \beta) = (-1)^q (1 - (-1)^{r+1}) E(u * \beta)$, and therefore

Corollary (3.11) $EEH_0[u, \beta] = 2(-1)^q E(u * \beta)$ if r is even,
 $= 0$ if r is odd.

iii) Next we shall define a Hopf invariant to more general group $\pi_p(X^*; \varepsilon^n, X)$. Let $\varphi_i; (X^*; \varepsilon^n, \tilde{X}) \rightarrow (X \vee S^n; S^n, \tilde{X})$ be a mapping identifying the subset $\bigcup_{i \neq j} \varepsilon_j^n \cup \varepsilon_i^n$ to the single point $x_0 = S^n \cap \tilde{X}$, and let $\phi_n; (\tilde{X} \times S^n, \tilde{X} \vee S^n) \rightarrow (E^n(X), x_0)$ be the shrinking map in (2.8). Then a *Hopf homomorphism* $H = \pi_p(X^*; \varepsilon^n, X) \rightarrow \pi_{p+1}(E^n(X))$ is defined by setting $H = \phi_n^* \circ Q \circ \varphi_i^*: \pi_p(X^*; \varepsilon^n, X) \rightarrow \pi_p(X \vee S^n; S^n, \tilde{X}) \rightarrow \pi_{p+1}(\tilde{X} \times S^n, \tilde{X} \vee S^n) \rightarrow \pi_{p+1}(E^n(X))$. Define a homomorphism $P_i: \pi_{p-n+1}(X, \varepsilon^n) \rightarrow \pi_p(X^*; \varepsilon^n, X)$ by setting $P_i(u) = [u, i]$, where i is a generator of $\pi_n(\varepsilon_i^n, \varepsilon_i^n)$. By (3.1), (2.12), (2.19) and (2.10) we have $H_i P_i(u) = \phi_n^* \circ Q \circ \varphi_i^*([u, i])_t = \phi_n^* \circ Q \circ [\varphi_i^*(u), i_n]_t = (-1)^n \phi_n^*(j' \circ j \circ \partial)^{-1} j' \circ j \circ \partial(\varphi_i^*(u) \times i_n) = (-1)^q \phi_n^*(\varphi_i^*(u) \times i_n) = (-1)^n E^n(\varphi_i^*(u))$. If $i \neq j$, $\varphi_i^*[u, i_j] = 0$ and hence $H_i P_j = 0$.

$$(3.12) \quad \begin{aligned} H_i P_j(u) &= (-1)^n E \varphi_i^*(u) & i = j, \\ &= 0 & i \neq j. \end{aligned}$$

If (X, ε^n) is smooth and m -connected, and if ε^n is r -connected, then $\varphi_i^*: \pi_{p-n+1}(X, \varepsilon^n) \rightarrow \pi_{p-n+1}(\tilde{X})$ is isomorphism onto for $p - n + 1 \leq m + p$ by (1.26), and $E^n: \pi_{p-n+1}(\tilde{X}) \rightarrow \pi_{p+1}(E^n(\tilde{X}))$ is isomorphism onto for $p - n + 1 \leq 2m$ by (2.6). Then the following theorem is algebraic consequence of the above considerations:

Theorem (3.13) *with above hypotheses $\pi_p(X^*; \varepsilon^n, X)$ has a direct factor isomorphic to $\pi_{p-n+1}(X, \dot{\varepsilon}^n) \otimes \pi_n(\varepsilon^n, \dot{\varepsilon}^n)$ for $p \leq n+m+\min(m, r)-1$.*

Combining this theorem to (1.27) we have

Corollary (3.14) *$\pi_p(\varepsilon^n, \dot{\varepsilon}^n)$ has a direct factor isomorphic to $\sum_i \pi_p(E^n, S^{n-1}) \oplus \pi_{p-n+1}(\dot{\varepsilon}^n) \otimes \pi_n(\varepsilon^n, \dot{\varepsilon}^n)$ for $p \geq n+\min(2r, n-2)-1$, where tensor product \otimes is induced by the relative product.*

Chapter 4. Some elements of $\pi_n(S^r)$.

i) It is well known that the mapping $\psi_n: (I^n, \dot{I}^n) \rightarrow (S^n, y_*)$ represents a generator ι_n of the infinite cyclic group $\pi_n(S^n) \approx \mathbb{Z}$, and that $\pi_n(S^1) = 0$ for $n > 1$, and $\pi_n(S^r) = 0$ for $n < r$.

There is fibre mappings $h_r: S^{2r-1} \rightarrow S^r (r=2, 4, 8)$ with fibre S^{r-1} , and they are represented by the Hopf construction of mappings of type $(\iota_{r-1}, \iota_{r-1})$. If h'_r is another fibre mapping, then there is a mapping $\chi: S^{2r-1} \rightarrow S^{2r-1}$ of degree 1 such that $h_r = h'_r \circ \chi$, and therefore $H(\{h_r\}) = E(\iota_{r-1}^* \iota_{r-1}) = \iota_{2r} = \pm H(\{h'_r\})$. As is shown in [5], the homomorphisms $h_r^*: \pi_n(S^{2r-1}) \rightarrow \pi_n(S^r)$ and $E; \pi_{n-1}(S^{r-1}) \rightarrow \pi_n(S^r)$ are isomorphisms into and

$$(4.1) \quad \pi_n(S^r) = h_r^* \pi_n(S^{2r-1}) \oplus E(\pi_{n-1}(S^{r-1})).$$

ii) By (4.1) $\pi_3(S^2) \approx \pi_3(S^3) \approx \mathbb{Z}$ and its generator η_2 is represented by h_2 . The fact $\pi_{n+1}(S^n) \approx \mathbb{Z}_2$ for $n \geq 3$ is shown by H. Freudenthal [8], and its generator η_n is the $(n-2)$ -fold suspension of η_2 . It was shown by G. W. Whitehead [23] that $\pi_{n+2}(S^n) \approx \mathbb{Z}_2 (n \geq 2)$ and its generator is $\eta_n \circ \eta_{n+1}$.

For convenience we modify the theorem (3.7). Let $u \in \pi_n(S^r)$ be an element such that $E(u) = 0$, then there is an element γ of $\pi_{n+2}(S^{r+1}; E_+^{r+1}, E_-^{r+1})$ such that $A(\gamma) = u$. By (3.7) we have $H(\gamma) - (-1)^{r+1} \iota_{2r+2} \circ H(\gamma) = (-1)^r E E H_0(u)$, hence we have $E E H_0(u) = 0$ if r is odd. If $n+2 \leq 2(2r+1)-1$, the suspension homomorphism $E: \pi_{n+2}(S^{2r+1}) \rightarrow \pi_{n+3}(S^{2r+2})$ is onto and there is an element β of $\pi_{n+2}(S^{2r+1})$ such that $E(\beta) = H(\gamma)$, and therefore we have by (2.4) $(-1)^r E E H_0(u) = E(\beta) - (-1)^{r+1} \iota_{3r+2} \circ E(\beta) = (1 - (-1)^{r+1}) E(\beta)$. Consequently we have

$$(4.2) \quad \begin{aligned} & \text{if } u \in \pi_n(S^r) \text{ and } E(u) = 0, \text{ we have} \\ & E E H_0(u) = 0 \quad \text{if } r \text{ is odd,} \\ & E E H_0(u) \in 2\pi_{n+3}(S^{2r+2}) \text{ if } r \text{ is even and } n \leq 4r-1. \end{aligned}$$

Since $2\pi_{r+2}(S^{r+1}) = 2\pi_{r+2}(S^r) = 0$ for $r \geq 2$, we have

$$(4.2') \quad \text{if } u \in \pi_{2r}(S^r) \text{ or } u \in \pi_{2r+1}(S^r) \text{ and } r \geq 2, \text{ and if } H(u) \neq 0, \text{ then } E(u) \neq 0.$$

For example $\eta_3 \circ \eta_4 \circ \eta_5$ is a nonzero element of $\pi_6(S^3)$.

iii) Let $q = x_1 + ix_2 + jx_3 + kx_4$ be a quaternion, then we may regard a point (x_1, x_2, x_3, x_4) of S^3 as a quaternion of unit absolute value and regard a point (x_1, x_2, x_3) of S^2 as a pure quaternion $ix_1 + jx_2 + kx_3$ of unit absolute value. The

product $p \cdot i \cdot p^{-1} = h(p)$ ($p \in S^3, i = (0, 1, 0, 0)$) defines a fibre mapping $h: S^3 \rightarrow S^2$ and h represents a generator of $\pi_3(S^2)$.

The products $p \cdot q = f(p, q)$ and $p \cdot q_0 \cdot p^{-1} = g(p, q)$ ($p, q \in S^3, q_0 \in S^2$) define mappings $f: S^3 \times S^3 \rightarrow S^3$ and $g: S^3 \times S^2 \rightarrow S^2$ of types (ι_3, ι_3) and $(\pm\eta_2, \iota_2)$ respectively. The Hopf construction of f is a fibre mapping, and let its class be $\nu_4 \in \pi_7(S_4)$, then $H(\nu_4) = \iota_8$ by (3.6). Let $\alpha_3 \in \pi_6(S^3)$ be the class of the Hopf construction of g , the $H(\alpha_3) = \iota_6$. Let ν_n and α_n be $(n-4)$ - and $(n-3)$ -fold suspensions of ν_4 and α_3 respectively. The author proved that [18]

Lemma (4.3) i) the $(n-3)$ -fold suspension $E^{n-3}: \pi_6(S^3) \rightarrow \pi_{n+3}(S^n)$ is isomorphism into for $n \geq 5$, and $\pi_{n+3}(S^n)/E^{n-3}(\pi_6(S^3)) \approx Z_2$,

ii) $[\iota_4, \iota_4] = 2\nu_4 - \alpha_4, 2\nu_n = \alpha_n$ for $n \geq 5$ and $\eta_n \circ \eta_{n+1} \circ \eta_{n+2} \neq 0$ for $n \geq 2$.

iv) Let f, g and h be mappings as in iii), then a diagram

$$\begin{array}{ccc} S^3 \times S^3 & \xrightarrow{f} & S^3 \\ \downarrow (i_3 \times h) & & \downarrow h \\ S^3 \times S^2 & \xrightarrow{g} & S^2 \end{array}$$

commutes, where $i_3: S^3 \rightarrow S^3$ is the identity map and $(i_3 \times h)(x, y) = (x, h(y))$. The definitions of Hopf construction, join and suspension shows that $E(\pm\eta_2) \circ \nu_4 = \alpha_3 \circ (\iota_3 * \eta_2) = \alpha_3 \circ \eta_6$. By (2.23), (2.24) and (4.3) we have $[\eta_4, \iota_4] = [\iota_4, \iota_4] \circ (\eta_3 * \iota_3) = (2\nu_4 - \alpha_4) \circ \eta_6 = (2\nu_4 \circ \eta_6) + \alpha_3 \circ \eta_6 = \alpha_3 \circ \eta_6$, and by (2.27) $\eta_5 \circ \nu_6 = \alpha_5 \circ \eta_8 = E[\eta_4, \iota_4] = 0$. By (3.4) we have $H(\eta_3 \circ \nu_4) = H(\alpha_3 \circ \eta_6) = H(\alpha_3) \circ \eta_7 = \eta_6 \circ \eta_7 \neq 0$ hence $\eta_3 \circ \nu_4 \neq 0$, and by (4.2)' we have $E(\eta_3 \circ \nu_4) = \eta_4 \circ \nu_5 \neq 0$. Consequently we obtain

Lemma (4.4) $\eta_n \circ \nu_{n+3} = \alpha_n \circ \eta_{n+3} \neq 0$ for $n = 3$ and 4,
 $= 0$ for $n \geq 5$.

v) It was shown in [19] [17] that the homotopy group $\pi_4(R_4)$ of the rotation group R_4 is the cyclic group of order 2 and the boundary homomorphism $\partial: \pi_5(R_5, R_4) \rightarrow \pi_4(R_4)$ is onto, and that the generator of $\pi_4(R_4)$ is given by $i^*(\alpha) \circ \eta_3$, where $\alpha \in \pi_3(R_3)$ is represented by $f(p)(q) = p \cdot q$ ($p, q \in S^3$). From (2.34) we have that $J(i^*(\alpha) \circ \eta_3) = J(i^*(\alpha \circ \eta_3)) = -EJ(\alpha \circ \eta_3) = EJ(\alpha \circ \eta_3)$ is represented by product $[\iota_5, \iota_5]$, and $J(\alpha \circ \eta_3) = J(\alpha) \circ (\eta_3 * \iota_3) = \nu_4 \circ \eta_7$. Therefore $[\iota_5, \iota_5] = E(\nu_4 \circ \eta_7) = \nu_5 \circ \eta_8$, and $\nu_6 \circ \eta_9 = E[\iota_5, \iota_5] = 0$. By (3.4) $H(\nu_4 \circ \eta_7) = \eta_8 \neq 0$ and $\nu_4 \circ \eta_7 \neq 0$, and by (4.3)' $E(\nu_4 \circ \eta_7) = \nu_5 \circ \eta_8 \neq 0$.

Lemma (4.5) $\nu_n \circ \eta_{n+3} \neq 0$ for $n = 4$ and 5
 $= 0$ for $n \geq 6$.

vi) Let q_i be a quaternion, then we may represent a point of C^{4n} by (q_1, \dots, q_n) . The equivalence relation $\{(q_1, \dots, q_n)\} = \{p(q_1, \dots, p q_n)\}$ induces quaternion projective space Q^{4n-1} with respect to the identification mapping $q'_{n-1}: C^{4n} - 0_* \rightarrow Q^{4n-1}$. Obviously $q'_{n-1}|C^{4n-1} - 0_* = q'_{n-2}$. With normalization process we obtain a fibre mapping $q_{n-1}: S^{4n-1} \rightarrow Q^{4n-1}$ and its fibre is S^3 . The

correspondence $(q_1, \dots, q_n) \rightarrow \{(q_1, \dots, q_n)\} \in Q^{4n}$ gives a homeomorphism: $C^{4n} \rightarrow Q^{4n} - Q^{4n-4}$, and this shows that there is a character mapping $\tilde{q}_{n-1}: (E^{4n}, S^{4n-1}) \rightarrow (Q^{4n}, Q^{4n-4})$ such that $q_{n-1}|S^{4n-1} = q_{n-1}$. Then we obtain a cell decomposition $Q^{4n} = S^4 \cup e^8 \cup \dots \cup e^{4n}$ of Q^{4n} . The fibre mapping $q_2: (S^{11}, S^7) \rightarrow (Q^8, S^3)$ induces isomorphism $q_2^*: \pi_n(S^{11}, S^7) \rightarrow \pi_n(Q^8, S^4)$. Consider the diagram

$$\begin{array}{ccccc} & & \partial & & \\ \pi_{11}(S^{11}, S^7) & \longrightarrow & \pi_{10}(S^7) & \longrightarrow & \pi_{10}(S^{11}) \\ & \downarrow q_2^* & \partial' & \downarrow q_1^* & \\ \pi_{11}(Q^8, S^4) & \longrightarrow & \pi_{10}(S^4) & & \end{array}$$

Since S^7 is contractible in S^{11} , ∂ is onto. Let $\tilde{\iota}_8 \in \pi_8(Q^8, S)$ be the class of \tilde{q}_1 , then $\partial \tilde{\iota}_8 = \{\iota_4\} = \nu_4$. There is an element γ of $\pi_{11}(S^{11}, S^7)$ such that $q_2^*(\gamma) = [\iota_4, \tilde{\iota}_8]_r$, for q_2^* is onto, and therefore $[\iota_4, \nu_4] = \partial[\iota_4, \iota_8]_r = \partial q_2^*(\gamma) = q_1^* \circ \partial'(\gamma)$. Set $\partial'(\gamma) = \beta \in \pi_{10}(S^7)$, then $[\iota_4, \nu_4] = \nu_4 \circ \beta$. We have $H_0[\iota_4, \nu_4] = 2E^{-1}(\iota_4 * \nu_4) = 2\nu_8$ by (3.11), and $H_0(\nu_4 \circ \beta) = E(\beta)$ by (3.4). Since $E: \pi_{10}(S^7) \rightarrow \pi_{11}(S^8)$ is isomorphism onto, we have $\beta = 2\nu_7$ and

Lemma (4.6) $[\iota_4, \nu_4] = 2\nu_4 \circ \nu_7$ and $2\nu_n \circ \nu_{n+3} = 0$ for $n \geq 5$.

Chapter 5. A construction of mapping.

i) Consider a mapping $F: (I^{n+1}, I^{n+1}) \rightarrow (X, x_0)$ which satisfies the conditions ($n \geq 2$):

$$\begin{aligned} (A_1) \quad & F(x_1, \dots, x_{n+1}) = F(x_1, \dots, x_{n-2}, x_{n-1} + 1/2, x_n, x_{n+1}) \\ & \text{for } 0 \leq x_{n-1} \leq 1/2 \text{ and } 0 \leq x_{n+1} \leq 1/2, \\ (A_2) \quad & F(x_1, \dots, x_{n+1}) = F(x_1, \dots, x_{n-1}, x_n + 1/2, x_{n+1}) \\ & \text{for } 0 \leq x_n \leq 1/2 \text{ and } 1/2 \leq x_{n+1} \leq 1. \end{aligned}$$

The formula

$$(5.1) \quad f(x_1, \dots, x_n) = F(x_1, \dots, x_{n-2}, x_{n-1}/2, x_n/2, 1/2)$$

represents a map $f: (I^n, I^n) \rightarrow (X, x_0)$. From (A_1) a map $F_1: (I^n, I^n) \rightarrow (X, x)$ given by $F_1(x_1, \dots, x_n) = F(x_1, \dots, 2x_{n-1}, x_n, 1/2)$ is the sum $f + f$ on the x_{n-1} -axis, and also from (A_2) the formula $F_0'(x_1, \dots, x_n) = F(x_1, \dots, x_{n-1}, 2x_n, 1/2)$ gives the sum $f + f$ on the x_n -axis. By setting $F_t(x_1, \dots, x_n) = F(x_1, \dots, x_{n-2}, 2x_{n-1}, x_n, t/2)$ and $F_t'(x_1, \dots, x_n) = F_t(x_1, \dots, x_{n-2}, x_{n-1}, 2x_n, (t+1)/2)$, we obtain null-homotopies of F_1 and F_0' respectively. Therefore

$$(A_3) \quad f \text{ represents an element } \alpha \text{ of } {}_2[\pi_n(X)],$$

where ${}_2[\pi_n(X)]$ is the subgroup of $\pi_n(X)$ generated by the elements of order 2.

Conversely for any element α of ${}_2[\pi_n(X)]$, there exists a map $F: (I^{n+1}, I^{n+1}) \rightarrow (X, x_0)$ satisfying the conditions (A_1) , (A_2) and (A_3) . Let F and F' be two maps which satisfy the above three conditions, and let f and f' be the restricted maps as in (5.1). Since f and f' represent the same element α , there is a homotopy $f_t: (I^n, I^n) \rightarrow (X, x_0)$ from $f = f_0$ to $f' = f_1$. Define a homotopy $g_t: (I^n, I^n) \rightarrow (X, x_0)$ by a rule

$$\begin{aligned} f_t(x_1, \dots, x_n) &= g_t(x_1, \dots, x_{n-2}, x_{n-1}/2, x_n/2) = g_t(x_1, \dots, x_{n-2}, x_{n-1}/2, (x_n+1)/2) \\ &= g_t(x_1, \dots, x_n, (x_{n-1}+1)/2, x_n/2) = g_t(x_1, \dots, x_{n-2}, (x_{n-1}+1)/2, (x_n+1)/2), \end{aligned}$$

then we have $g_0(x_1, \dots, x) = F(x_1, \dots, x_n, 1/2)$ and $g_1(x_1, \dots, x_n) = F'(x_1, \dots, x_n, 1/2)$. Define two maps F_+ and $F_-: (I^{n+1}, \dot{I}^{n+1}) \rightarrow (X, x_0)$ by setting

$$\begin{aligned} F_+(x_1, \dots, x_n, t) &= F(x_1, \dots, x_n, (2-3t)/2) & 0 \leq t \leq 1/3, \\ &= g_{3t-1}(x_1, \dots, x_n) & 1/3 \leq t \leq 2/3, \\ &= F'(x_1, \dots, x_n, (3t-1)/2) & 2/3 \leq t \leq 1. \end{aligned}$$

and

$$\begin{aligned} F_-(x_1, \dots, x_n, t) &= F'(x_1, \dots, x_n, 3t/2) & 0 \leq t \leq 1/3, \\ &= g_{2-3t}(x_1, \dots, x_n) & 1/3 \leq t \leq 2/3, \\ &= F(x_1, \dots, x_n, (3-3t)/2) & 2/3 \leq t \leq 1. \end{aligned}$$

It is easily verified that the sum $F_+ + (F + F_-)$ on the x_{n+1} -axis is homotopic to F' . Since $F_+(x_1, \dots, x_{n-1}, x_n, x_{n+1}) = F_+(x_1, \dots, x_{n-1}, x_n+1/2, x_{n+1})$ for $0 \leq x_n \leq 1/2$, F_+ is the sum $F'_+ + F_+$ on the x_n -axis, where $F'_+(x_1, \dots, x_{n+1}) = F_+(x_1, \dots, x_{n-1}, x_n/2, x_{n+1})$, and hence the class of F_+ belongs to $2(\pi_{n+1}(X))$. Similarly the class of F_- belongs to $2(\pi_{n+1}(X))$. Consequently we have

(5.2) the class $\{F\}$ of in $\pi_{n+1}(X)/2\pi_{n+1}(X)$ depends only on α , and it is denoted by $T(\alpha)$.

If $n \geq 5$, and if F_1 and F_2 are representatives of $T(\alpha)$ and $T(\beta)$ respectively, a representative F of $T(\alpha + \beta)$ is given by the sum $F_1 + F_2$ on the x_1 -axis. Therefore $T(\alpha) + T(\beta) = T(\alpha + \beta)$, and we obtain a homomorphism

$$(5.3) \quad T_2: 2[\pi_n(X)] \rightarrow \pi_{n+1}(X)/2\pi_{n+1}(X) \quad (n \geq 3).$$

In the case $n=2$, by theorem (5.15) of [22] and the following theorem we have $T(\alpha + \beta) = T(\alpha) + T(\beta) + \{[\alpha, \beta]\}$.

Theorem (5.4) $T(\alpha)$ is the class of $\alpha \circ \eta_n$.

To prove the theorem we shall give a representative of $T(\alpha)$ by spherical mappings. Let $\varepsilon: (E^n, S^{n-1}) \rightarrow (I^n, \dot{I}^n)$ be the homeomorphism given by

$$\varepsilon(x_1, \dots, x_n) = \left(\frac{1+\rho x_1}{2}, \dots, \frac{1+\rho x_n}{2} \right), \text{ where } \rho = \frac{\sqrt{x_1^2 + \dots + x_n^2}}{\max(|x_1|, \dots, |x_n|)}$$

Define a map $\chi_1: I^{n+1} \rightarrow E^n$ by setting for $0 \leq x_{n-1} \leq 1/2$ and $0 \leq x_n \leq 1/2$

$$\begin{aligned} \chi_1(x_1, \dots, x_{n+1}) &= \varepsilon^{-1}(x_1, \dots, x_{n-2}, 2x_n, 2x_{n+1}) & \text{if } 0 \leq x_{n+1} \leq x_{n-1}, \\ &= \varepsilon^{-1}(x_1, \dots, x_{n-2}, 2x_n, 2x_{n-1}) & \text{if } x_{n-1} \leq x_{n+1} \leq 1-x_n, \\ &= \varepsilon^{-1}(x_1, \dots, x_{n-2}, 2-2x_{n+1}, 2x_{n-1}) & \text{if } 1-x_n \leq x_{n+1} \leq 1, \end{aligned}$$

and by adjoining the condition

$$\chi_1(x_1, \dots, x_{n+1}) = \chi_1(x_1, \dots, x_{n-1}, 1-x_n, x_{n+1}) = \chi_1(x_1, \dots, x_{n-1}, 1-x_n, x_{n+1}).$$

for the other values of x_{n-1} and x_n

Set $L_+ = \{(x_1, \dots, x_{n+1}) \in I^{n+1} | x_n = 1/2, x_{n+1} \geq 1/2\}$ and $L_- = \{(x_1, \dots, x_{n+1}) \in I^{n+1} | x_{n-1} = 1/2, x_{n+1} \leq 1/2\}$. We may represent a point (x_1, x_2) of S^1 by a radian θ such that $(\cos \theta, \sin \theta) = (x_1, x_2)$. Define a mapping: $\chi_2: I^{n+1} - \dot{I}^{n+1} - L_+ - L_- \rightarrow S^1$ by setting

$$\begin{aligned}
\chi_2(x_1, \dots, x_{n+1}) &= -\pi/4 && 0 < x_{n-1} < 1/2, 1/2 < x_n < 1 \text{ and } x_{n+1} = 1/2, \\
&= \frac{1}{2} \operatorname{Arctan} \frac{1-2x_n}{1-2x_{n+1}} && 0 < x_{n-1} < 1/2 \text{ and } 0 < x_{n+1} < 1/2, \\
&= \frac{\pi}{4} && 0 < x_{n-1} < 1/2, 0 < x_n < 1/2 \text{ and } x_{n+1} = 1/2, \\
&= \frac{\pi}{2} + \frac{1}{2} \operatorname{Arctan} \frac{1-2x_{n-1}}{1-2x_{n+1}} && 0 < x_n < 1/2 \text{ and } 1/2 < x_{n+1} < 1, \\
&= 3\pi/4 && 1/2 < x_{n-1} < 1, 0 < x_n < 1/2 \text{ and } x_{n+1} = 1/2, \\
&= \pi - 1/2 \operatorname{Arctan} \frac{1-2x_n}{1-2x_{n+1}} && 1/2 < x_{n+1} < 1 \text{ and } 0 < x_{n+1} < 1/2, \\
&= 5\pi/4 && 1/2 < x_{n-1} < 1, 1/2 < x_n < 1 \text{ and } x_{n+1} = 1/2, \\
&= 3/2\pi - 1/2 \operatorname{Arctan} \frac{1-2x_{n-1}}{1-2x_{n+1}} && 1/2 < x_n < 1 \text{ and } 1/2 < x_{n+1} < 1.
\end{aligned}$$

For a fixed point $\theta \in S^1$, the inverse image $\chi_2^{-1}(\theta)$ is an open n -cube in I^{n+1} and χ_1 maps $\chi_2^{-1}(\theta)$ homeomorphically onto $E^n - S^{n-1}$. Therefore the formula $\chi(x) = (\chi_1(x), \chi_2(x))$ gives a homeomorphism $\chi: I^{n+1} - \dot{I}^{n+1} - L_+ - L_- \rightarrow (E^n - S^{n-1}) \times S^1$.

Define a map $\phi: E^n \times S^1 \rightarrow S^{n+1}$ by $\phi(x_1, \dots, x_n, y_1, y_2) = (x_1, \dots, x_n, \mu y_1, \mu y_2)$, where $(x_1, \dots, x_n) \in E^n$, $(y_1, y_2) \in S^1$ and $\mu = (1 - x_1^2 - \dots - x_n^2)^{\frac{1}{2}}$, then ϕ maps $(E^n - S^{n-1}) \times S^1$ homeomorphically onto $S^{n+1} - S^{n-1}$.

Define a map $\psi: (I^{n+1}, \dot{I}^{n+1} \cup L_+ \cup L_-) \rightarrow (S^{n+1}, S^{n-1})$ by setting

$$\psi(x) = \phi(\chi(x)) \quad \text{for } x \in I^{n+1} - \dot{I}^{n+1} - L_+ - L_-,$$

$$\text{and} \quad \psi(x) = (\chi_1(x), 0, 0) \quad \text{for } x \in \dot{I}^{n+1} \cup L_+ \cup L_-,$$

then ψ maps $I^{n+1} - \dot{I}^{n+1} - L_+ - L_-$ homeomorphically onto $S^{n+1} - S^{n-1}$.

Since F maps $\dot{I}^{n+1} \cup L_+ \cup L_-$ into the single point x_0 , there is a unique map $H: (S^{n+1}, S^{n-1}) \rightarrow (X, x_0)$ such that $F = H \circ \psi$. It is verified from the definition of ψ that the map H satisfies the conditions:

- (B₁) $H(\phi(x_1, \dots, x_n, \theta)) = H(\phi(x_1, \dots, x_{n-1}, x_n, \pi - \theta)) \quad -\pi/4 \leq \theta \leq \pi/4,$
- (B₂) $H(\phi(x_1, \dots, x_n, \theta)) = H(\phi(x_1, \dots, x_{n-1}, -x_n, 2\pi - \theta)) \quad \pi/4 \leq \theta \leq 3\pi/4,$
- (B₃) and a map $h: (E^n, S^{n-1}) \rightarrow (X, x_0)$ giving by $h(x_1, \dots, x_n) = H(\phi(x_1, \dots, x_n, y_*))$ represents a .

Conversely, for any map $H: (S^{n+1}, S^{n-1}) \rightarrow (X, x_0)$ satisfying the above three conditions, the composite map $H \circ \psi = F: (I^{n+1}, \dot{I}^{n+1}) \rightarrow (X, x_0)$ satisfies the conditions (A₁), (A₂) and (A₃).

Since $\psi|_{\dot{I}^{n+1}}$ does not cover the point $(0, 0, \dots, 0, 1)$ of S^{n-1} , the map $\psi|_{\dot{I}^{n+1}}$ is inessential in S^{n-1} . Hence the map $\psi(I^{n+1}, \dot{I}^{n+1}) \rightarrow (S^{n+1}, S^{n-1})$ is extendable to \dot{I}^{n+1} such that $\psi(\dot{I}^{n+1}) \subset S^{n-1}$. Obviously the Brouwer's degree of the resultant map $\psi: \dot{I}^{n+2} \rightarrow S^{n+1}$ is ± 1 .

The composite map $H \circ \psi: \dot{I}^{n+2} \rightarrow X$ carries the subset \dot{J}^{n+1} into the reference point x_0 , and hence $H \circ \psi$ represents the same element of $\pi_{n+1}(X)$ with $H \circ \psi|_{\dot{I}^{n+1}}$. Consequently the map H satisfying the conditions (B₁), (B₂) and

(B_3) represents $\pm T(a) = T(a) \in \pi_{n+1}(X)/2\pi_{n+1}(X)$.

Let $h_0: (E^n, S^{n-1}) \rightarrow (X, x_0)$ be a representative of $a \in {}_2[\pi_n(X)]$, then there is a homotopy $h_t: (E^n, S^{n-1}) \rightarrow (X, x_0)$ such that $h_1(x_1, \dots, x_n) = h_0(x_1, \dots, x_{n-1}, -x_n)$, since h_1 represents $-a$ and $a = -a$.

Define a map $H_0: (S^{n+1}, S^{n-1}) \rightarrow (X, x_0)$ by setting

$$\begin{aligned} H_0(\phi(x_1, \dots, x_n, \theta)) &= h_{\frac{2\theta}{\pi} + \frac{1}{2}}(x_1, \dots, x_n) & -\pi/4 \leq \theta \leq \pi/4, \\ &= h_{\frac{3}{2} - \frac{2\theta}{\pi}}(\rho_{(2\theta - \frac{\pi}{2})}(x_1, \dots, x_n)) & \pi/4 \leq \theta \leq 3\pi/4, \\ &= h_{\frac{3}{2} - \frac{2\theta}{\pi}}(x_1, \dots, -x_{n-1}, x_n) & 3\pi/4 \leq \theta \leq 5\pi/4, \\ &= h_{\frac{2\theta}{\pi} - \frac{5}{2}}(\rho_{(\frac{3}{2}\pi - 2\theta)}(x_1, \dots, x_{n-1}, -x_n)) & 5\pi/4 \leq \theta \leq 7\pi/4, \end{aligned}$$

then H_0 satisfies the conditions (B_1) , (B_2) and (B_3) , and represents $T(a)$.

Give a homotopy $H_t: S^{n+1} \rightarrow X$ by setting for $0 \leq t \leq 1$

$$\begin{aligned} H_t(\phi(x_1, \dots, x_n, \theta)) &= h_{(\frac{2\theta}{\pi} + \frac{1}{2})(1-t)}(x_1, \dots, x_n) & -\pi/4 \leq \theta \leq \pi/4, \\ &= h_{(\frac{3}{2} + \frac{2\theta}{\pi})(1-t)}(\rho_{(2\theta - \frac{\pi}{2})}(x_1, \dots, x_n)) & \pi/4 \leq \theta \leq 3\pi/4, \\ &= h_{t + (\frac{5}{2} - \frac{2\theta}{\pi})(1-t)}(x_1, \dots, -x_{n-1}, x_n) & 3\pi/4 \leq \theta \leq 5\pi/4, \\ &= h_{t + (\frac{2\theta}{\pi} - \frac{5}{2})(1-t)}(\rho_{(\frac{3}{2}\pi - 2\theta)}(x_1, \dots, x_{n-1}, -x_n)) & 5\pi/4 \leq \theta \leq 7\pi/4, \end{aligned}$$

and by setting for $1 \leq t \leq 2$

$$\begin{aligned} H_t(\phi(x_1, \dots, x_n, \theta)) &= h_0(\rho_{(\theta(t-1))}(x_1, \dots, x_n)) & -\pi/4 \leq \theta \leq \pi/4, \\ &= h_0(\rho_{(\theta(t-1) + (2\theta - \frac{\pi}{2})(2-t))}(x_1, \dots, x_n)) & \pi/4 \leq \theta \leq 3\pi/4, \\ &= h_0(\rho_{(\theta(t-1) + \pi(2-t))}(x_1, \dots, x_n)) & 3\pi/4 \leq \theta \leq 5\pi/4, \\ &= h_0(\rho_{(\theta(t-1) + (2\theta + \frac{\pi}{2})(2-t))}(x_1, \dots, x_n)) & 5\pi/4 \leq \theta \leq 7\pi/4, \end{aligned}$$

then H_0 is homotopic to H_2 which is given by

$$H_2(\phi(x_1, \dots, x_n, \theta)) = h_0(\rho_{(\theta)}(x_1, \dots, x_n)).$$

Let $\omega: E^n \rightarrow S^n$ be a map given by

$$\begin{aligned} \omega(x_1, \dots, x_n) &= (2x_1, \dots, 2x_n, \mu_-) & \text{for } \sum x_i^2 \leq 1/4, \\ &= (1-2x_1, \dots, 1-2x_n, \mu_+) & \text{for } 1/4 \leq \sum x_i^2 \leq 1, \end{aligned}$$

where $\mu_- = -(1 - 4\sum x_i^2)^{\frac{1}{2}}$ and $\mu_+ = (1 - \sum (1 - 2x_i)^2)^{\frac{1}{2}}$. Then $\omega|E^n - S^{n-1}$ is a homeomorphism, and there is a map $h': S^n \rightarrow X$ such that $h' \circ \omega = h_0$, and h' represents $\pm a$. Let $\bar{\mu}_n$ be the map given by

$$\bar{\mu}_n(\phi(x_1, \dots, x_n, \theta)) = \omega(r_\theta(x_1, \dots, x_n)),$$

then $H_2 = h' \circ \bar{\mu}_n$.

For $n=2$, $\bar{\mu}_2: S^3 \rightarrow S^2$ is the Hopf construction of a mapping $\bar{\mu}_2| \phi(S^1_{\frac{1}{2}} \times S^1)$ of type (ι_1, ι_1) , where $S^1_{\frac{1}{2}} = \{(x_1, x_2) | x_1^2 + x_2^2 = 1/2\}$, and $\phi|S^1_{\frac{1}{2}} \times S^1$ is a homeomorphism. Therefore the Hopf invariant of $\bar{\mu}_2$ is $\pm \iota_4$ and $\bar{\mu}_2$ represents $\pm \gamma_2 \in \pi_3(S^2)$.

For $n > 2$, $\bar{\mu}_n: S^{n+1} \rightarrow S^n$ maps hemispheres E_{+1}^{n+1} and E_{-1}^{n+1} into hemispheres E_{+1}^n and E_{-1}^n respectively, and we have $\bar{\mu}_n(x_2, \dots, x_{n+1}) = \bar{\mu}_{n-1}(x_2, \dots, x_{n+1})$. Hence $\bar{\mu}_n$ is homotopic to $(-1)^n E(\bar{\mu}_{n-1})$, and by induction we see that $\bar{\mu}_n$ represents $\eta_n \in \pi_{n+1}(S^n)$.

Consequently we have

$$T(u) = \{H_0\} = \{H_2\} = \{h' \circ \bar{\mu}_n\} = \pm \{u \circ \eta_n\} = \{u \circ \eta_n\} \quad \text{in } \pi_{n+1}(X)/2\pi_{n+1}(X)$$

and the proof of the theorem (5.4) is accomplished.

ii) Assume that elements $u \in \pi_r(S^s)$, $\beta \in \pi_m(S^r)$ and $\gamma \in \pi_n(S^m)$ satisfy conditions $u \circ \beta = 0$, and $\beta \circ \gamma = 0$. Let $f: S^r \rightarrow S^s$, $g: S^m \rightarrow S^r$ and $h: S^n \rightarrow S^m$ be representatives of u, β and γ respectively, and let $F_t: S^m \rightarrow S^s$ and $G_t: S^n \rightarrow S^r$ be nullhomotopies of $f \circ g = F_0$ and $g \circ h = G_0$. Define a map $H: S^{n+1} \rightarrow S^s$ by the rule

$$(5.5) \quad \begin{aligned} H(d_n(x, t)) &= f(G_t(x)) & 0 \leq t \leq 1, \\ &= F_{-t}(h(x)) & -1 \leq t \leq 0. \end{aligned}$$

The construction of H depends on the choice of f, g, h, F_t and G_t . Let H' be another construction as above with respect to f', g', h', F'_t and G'_t , and let f_t, g_t and h_t be homotopies from $f=f_0, g=g_0$ and $h=h_0$ to $f'=f_1, g'=g_1$ and $h'=h_1$ respectively. Define a homotopy $H_\tau: S^{n+1} \rightarrow S^s$ by

$$\begin{aligned} H_\tau(d_n(x, t)) &= f_\tau(G_{(2t-\tau)/(2-\tau)}(x)) & 0 \leq t \leq 1, \\ &= f_\tau(g_{\tau+2t}(h_{\tau+2t}(x))) & 0 \leq t \leq \tau/2 \leq 1, \\ &= f_{\tau+2t}(g_{\tau+2t}(h_\tau(x))) & -1 \leq -\tau/2 \leq t \leq 0, \\ &= F_{(\tau+2t)/(\tau-2)}(h_\tau(x)) & -1 \leq t \leq -\tau/2 \leq 0, \end{aligned}$$

then $H_0 = H$ and $H_1|S^n = H'|S^n$. Define two maps H_+ and $H_-: S^{n+1} \rightarrow S^s$ by

$$\begin{aligned} H_+(d_n(x, t)) &= H_1(d_n(x, t)) & 0 \leq t \leq 1, \\ &= H'(d_n(x, -t)) & -1 \leq t \leq 0, \end{aligned}$$

and

$$\begin{aligned} H_-(d_n(x, t)) &= H'(d_n(x, -t)) & 0 \leq t \leq 1, \\ &= H_1(d_n(x, t)) & -1 \leq t \leq 0, \end{aligned}$$

then H_+ represents an element of $u \circ \pi_{n+1}(S^r)$ and H_- represents an element of $\pi_{m+1}(S^s) \circ E(\gamma)$, where $u \circ \pi_{n+1}(S^r)$ and $\pi_{m+1}(S^r) \circ E(\beta)$ are subgroups of $\pi_{n+1}(S^s)$ consisted of the elements of the forms $u \circ \zeta$ and $\xi \circ E(\beta)$ ($\zeta \in \pi_{n+1}(S^r)$, $\xi \in \pi_{m+1}(S^r)$) respectively. As is easily seen, the sum $H_+ + (H' + H_-)$ is homotopic to H_1 , and therefore

(5.6) *the class of H in $\pi_{n+1}(S^s)/u \circ \pi_{n+1}(S^r) + \pi_{m+1}(S^s) \circ E(\gamma)$ depends only on u, β and γ , and it is denoted by $\{u, \beta, \gamma\}$.*

Theorem (5.7) *If $u \in {}_2[\pi_n(S^r)]$ and if $2 < n < 2r-2$, then*

$$\{2r, u, 2n\} = T(u) = \{u \circ \eta_n\} \quad \text{in } \pi_{n+1}(S^r)/2\pi_{n+1}(S^r).$$

Since the suspension homomorphism $E: \pi_{n-1}(S^{r-1}) \rightarrow \pi_n(S^r)$ is an isomor-

phism onto for $n < 2r - 2$, there is an element u' of $\pi_{n-1}(S^{r-1})$ such that $E(u') = u$ and $2u' = 0$. By (2.5) we have $2\iota_r \circ u = (\iota_r + \iota_r) \circ E(u') = E(u') + E(u') = 2u = 0$. Let $f' : (S^{n-1}, y_*) \rightarrow (S^{r-1}, y_*)$ be a representative of u' , and let $g_t' : (S^{n-1}, y_*) \rightarrow (S^{r-1}, y_*)$ be a nullhomotopy of $f' \circ 2_{n-1} = g_0'$, where $2_m : S^m \rightarrow S^m (m \geq 1)$ is a map of degree 2 given by

$$\begin{aligned} 2_m(d_{m-1}(x, t)) &= d_{m-1}(x, 2t-1) & 0 \leq t \leq 1, \\ &= d_{m-1}(x, 2t+1) & -1 \leq t \leq 0. \end{aligned}$$

Set $f = Ef'$ and $g_t = Eg_t'$, then f represents u and g_t is a nullhomotopy of $f \circ E2_{n-1} = g_0$. Let $f_t : (S^n, y_*) \rightarrow (S^r, y_*)$ be a nullhomotopy of $2_r \circ f = f_0$. Then $\{2\iota_r, u, 2\iota_n\}$ is represented by a map $H : (S^{n+1}, y_*) \rightarrow (S^r, y_*)$ given by

$$\begin{aligned} H(d_n(x, t)) &= 2_r(g_t(x)) & 0 \leq t \leq 1, \\ &= f_{-t}(E2_{n-1}(x)) & -1 \leq t \leq 0. \end{aligned}$$

Now we shall calculate the composite map $H \circ \psi_{n+1} : (I^{n+1}, I^{n+1}) \rightarrow (S^r, y_*)$ which is a representative of $\{2\iota_r, u, 2\iota_n\}$. Since $\psi_{m+1}(x_1, \dots, x_{m+1}) = d_m(\psi_m(x_1, \dots, x_m), 2x_{m+1}-1)$ and $2_m(d_{m-1}(x, t)) = 2_m(d_{m-1}(x, t+1))$ for $-1 \leq t \leq 0$, we have

$$\begin{aligned} H(\psi_{n+1}(x_1, \dots, x_{n+1})) &= H(d_n(\psi_n(x_1, \dots, x_n), 2x_{n+1}-1)) \\ &= 2_r(Eg_{2t-1}'(d_{n-1}(\psi_{n-1}(x_1, \dots, x_{n-1}), 2x_n-1))) = 2_r(d_{r-1}(g_{2t-1}'(\psi_{n-1}(x_1, \dots, x_{n-1}), 2x_n-1))) \\ &= 2_r(d_{r-1}(g_{2t-1}'(\psi_{n-1}(x_1, \dots, x_{n-1})), 2x_n+1))) \\ &= H(\psi_{n+1}(x_1, \dots, x_{n-1}, x_n+1/2, x_{n+1})) \quad \text{for } 0 \leq x_n \leq 1/2 \text{ and } 1/2 \leq x_{n+1} = t \leq 1, \end{aligned}$$

$$\begin{aligned} H(\psi_{n+1}(x_1, \dots, x_{n+1})) &= H(d_n(\psi_n(x_1, \dots, x_n), 2x_{n+1}-1)) \\ &= f_{1-2t}(E2_{n-1}(d_{n-1}(\psi_{n-1}(x_1, \dots, x_{n-1}), 2x_n-1))) \\ &= f_{1-2t}(d_{n-1}(2_{n-1}(d_{n-2}(\psi_{n-2}(x_1, \dots, x_{n-2}), 2x_{n-1}-1)), 2x_n-1)) \\ &= f_{1-2t}(d_{n-1}(2_{n-1}(d_{n-2}(\psi_{n-2}(x_1, \dots, x_{n-2}), 2x_{n-1}+1)), 2x_n-1)) \\ &= H(\psi_{n+1}(x_1, \dots, x_{n-1}+1/2, x_n, x_{n+1})) \quad \text{for } 0 \leq x_{n-1} \leq 1/2 \text{ and } 0 \leq x_{n-1} = t \leq 1/2. \end{aligned}$$

$$\begin{aligned} \text{and } H(\psi_{n+1}(x_1, \dots, x_{n-2}, x_{n-1}/2, x_n/2, 1/2)) \\ &= H(d_n(\psi_n(x_1, \dots, x_{n-2}, x_{n-1}/2, x_n/2), 0)) \\ &= (2_r \circ Ef' \circ E2_{n-1})(d_{n-1}(\psi_{n-1}(x_1, \dots, x_{n-2}, x_{n-1}/2), x_n-1)) \\ &= 2(d_{r-1}(f'(2_{n-1}(d_{n-2}(\psi_{n-2}(x_1, \dots, x_{n-2}), x_{n-1}-1)), x_n-1))) \\ &= d_{r-1}(f'(d_{n-2}(\psi_{n-2}(x_1, \dots, x_{n-2}), 2x_{n-1}-1))2x_n-1) \\ &= d_{r-1}(f'(\psi_{n-1}(x_1, \dots, x_{n-1})), 2x_n-1) \\ &= f(\psi_n(x_1, \dots, x_n)). \end{aligned}$$

Therefore H satisfies the conditions (A_1) , (A_2) and (A_3) , and represents $T(u)$. Consequently we obtain $\{2\iota_r, u, 2\iota_n\} = \{H\} = T(u)$ in $\pi_{n+1}(S^r)/2\pi_{n+1}(S^r)$.

Lemma (5.8) *If elements $u \in \pi_r(S^s)$, $\beta \in \pi_m(S^r)$, $\gamma \in \pi_n(S^r)$ and $\delta \in \pi_l(S^n)$ satisfy $u \circ \beta = 0$, $\beta \circ \gamma = 0$, and $\gamma \circ \delta = 0$, then*

$$u \circ \{\beta, \gamma, \delta\} = \{u, \beta, \gamma\} \circ E(-\delta) \text{ in } \pi_{l+1}(S^s)/u \circ \pi_{n+1}(S^r) \circ E(\delta).$$

In the lemma, $\alpha \circ \{\beta, \gamma, \delta\}$ and $\{\alpha, \beta, \gamma\} \circ E(-\delta)$ are classes of $\alpha \circ \zeta$ and $\xi \circ E(-\delta)$ (for elements $\zeta \in \{\beta, \gamma, \delta\}$ and $\xi \in \{\alpha, \beta, \gamma\}$) respectively in the factor group $\pi_{l+1}(S^s)/\alpha \circ (\beta \circ \pi_{l+1}(S^m) + \pi_{n+1}(S^r) \circ E(\delta)) = \pi_{l+1}(S^s)/\alpha \circ \pi_{n+1}(S^r) \circ E(\delta) = \pi_{l+1}(S^s)/(\alpha \circ \pi_{n+1}(S^r) + \pi_{m+1}(S^s) \circ E(\gamma)) \circ E(-\delta)$. Let f, g, h and k be representatives of α, β, γ and δ , and let F_t, G_t and H_t be nullhomotopies of $f \circ g, g \circ h$ and $h \circ k$ respectively. Consider a homotopy $K_\tau: S^{l+1} \rightarrow S^s$ which is given by

$$\begin{aligned} K_\tau(d_t(x, t)) &= f(G_t(k(x))) & 0 \leq t \leq 1, \\ &= F_{t(\tau-1)}(H_{-t\tau}(x)) & -1 \leq t \leq 0, \end{aligned}$$

then K_0 represents $\{\alpha, \beta, \gamma\} \circ E(-\delta)$ and K_1 represents $\alpha \circ \{\beta, \gamma, \delta\}$, and it follows from this that we have the lemma.

iii) In this section we shall use the notations of the previous section and assume that $\alpha \circ \beta = 0$, and $\beta \circ \gamma = 0$.

Let $K_\alpha^{r+1} = S^s \cup e^{r+1}$ be a cell complex, in which e^{r+1} is attached to S^s by a characteristic map $\tilde{\alpha}: (E_+^{r+1}, S^r) \rightarrow (K_\alpha^{r+1}, S^s)$ such that $\tilde{\alpha}|S^r = f$ represents α . Define a mapping, $\tilde{g}: S^{m+1} \rightarrow K_\alpha^{r+1}$ by setting

$$\begin{aligned} \tilde{g}(d_m(x, t)) &= \tilde{\alpha}(d_m(g(x), t)) & 0 \leq t \leq 1, \\ &= F_{-t}(x) & -1 \leq t \leq 0, \end{aligned}$$

then \tilde{g} represents an element $\tilde{\beta}$ of $\pi_{m+1}(K_\alpha^{r+1})$.

Lemma (5.9) $\tilde{g} \circ E(h)$ is homotopic to a mapping $S^{n+1} \rightarrow S^s$ which represents $\{\alpha, \beta, \gamma\}$.

The lemma follows from a homotopy H_τ given by

$$\begin{aligned} H_\tau(d_n(x, t)) &= \tilde{\alpha}(d_n(G_{t\tau}(x), t)) & 0 \leq t \leq 1, \\ &= F_{-t}(h(x)) & -1 \leq t \leq 0. \end{aligned}$$

iv) For example, consider an element $\zeta \in \pi_{r+3}(S^r)$ of $\{\eta_r, 2\eta_{r+1}, \eta_{r+1}\}$, then from (5.8) we have $2\zeta = \zeta \circ 2\eta_{r+3} = \eta_r \circ \xi$ for an element ξ of $\{2\eta_{r+1}, \eta_{r+1}, 2\eta_{r+2}\}$, and from (5.7) $\{2\eta_{r+1}, \eta_{r+1}, 2\eta_{r+2}\} = \eta_{r+1} \circ \eta_{r+2}$ in $\pi_{r+3}(S^{r+1})$ ($r \geq 3$). Therefore

Lemma (5.10) There is an element ζ of $\pi_{r+3}(S^r)$ such that $2\zeta = \eta_r \circ \eta_{r+1} \circ \eta_{r+2} \neq 0$, and ζ has order 4. ($r \geq 3$).

Chapter 6. Eilenberg-MacLane complex.

Let $K(\Pi, n)$ be the complex of a (abelian) group Π which is defined and treated by S. Eilenberg and S. MacLane [7]. A q -cell of $K(\Pi, n)$ is an n -dimensional cocycle $\sigma^q \in Z_n(\mathcal{A}_q; \Pi)$ of the q -dimensional ordered simplex \mathcal{A}_q . The *suspension homomorphism* $S: H_q(K(\Pi, n)) \rightarrow H_{q+1}(K(\Pi, n+1))$ is given by setting $S\sigma^q = T\sigma^q - \sigma_0^{q+1}$, where $\sigma_0^{q+1}(\mathcal{A}) = 0 \in \Pi$ and $T\sigma^q$ is defined for each $(n+1)$ -dimensional ordered subsimplex (r_0, \dots, r_{n+1}) of $\mathcal{A}_{q+1} = (0, \dots, q+1)$ such as

$$\begin{aligned} T\sigma^q(r_0, \dots, r_{n+1}) &= \sigma^q(r_0, \dots, r_n) & \text{if } r_{n+1} = q+1, \\ &= 0 & \text{if } r_{n+1} < q+1. \end{aligned}$$

S. Eilenberg and S. MacLane reduced the complex $K(\Pi, n)$ to $A(\Pi, n)$ and calculated the following results for the infinite cycle group Z ,

$$(6.1) \quad \begin{aligned} H_{n+1}(K(Z, n)) &= 0 & n \geq 1, & & H_{n+2}(K(Z, n)) &= Z_2 & n \geq 3, \\ H_{n+3}(K(Z, n)) &= 0 & n \geq 4, & & H_{n+4}(K(Z, n)) &= Z_2 + Z_3 & n \geq 5, \\ H_{n+5}(K(Z, n)) &= 0 & n \geq 6, & & H_{n+6}(K(Z, n)) &= Z_2 + Z_2 & n \geq 7, \\ H_{n+7}(K(Z, n)) &= 0 & n \geq 8, & & H_{n+8}(K(Z, n)) &= Z_2 + Z_2 + Z_3 + Z_5 & n \geq 9, \\ H_{n+9}(K(Z, n)) &= Z_2 & n \geq 10. \end{aligned}$$

In particular, $H_{n+4}(K(Z, n))$ are calculated for lower dimensions:

$$(6.2) \quad H_6(K(Z, 2)) = Z, H_7(K(Z, 3)) = Z_3, H_8(K(Z, 4)) = Z + Z_3 \text{ and the suspension homomorphism } S: H_6(K(Z, 2)) \rightarrow H_7(K(Z, 3)) \text{ is onto and the } (n-3)\text{-fold suspension } S^{n-3}: H_7(K(Z, 3)) \rightarrow H_{n+4}(K(Z, n)) \text{ is an isomorphism into.}$$

Let K_n be a CW -complex such that its $(n+1)$ -skeleton is an n -sphere S^n and homotopy groups $\pi_i(K_n)$ for $i > n$ vanish. The existence of such a complex was shown by J. H. C. Whitehead [24]. Furthermore we may assume that the $(n+k)$ -skeleton K_n^{n+k} of K_n is a finite cell complex, for the homotopy groups of a finite complex are finitely generated (cf. [14]). Therefore the singular homology groups of K_n coincide to the usual homology groups.

Consider the suspended space $'K = E(K_n)$ of K_n with reference point y_* $\in S^n \subset K_n$, then $'K$ is also a cell complex and its $(n+2)$ -skeleton is S^{n+1} .

Let $\chi: (E^{n+k+1}, S^{n+k}) \rightarrow ('K^{n+k} \cup e^{n+k+1}, 'K^{n+k})$ be a characteristic map of a cell $e^{n+k+1} \in 'K$, and let a mapping $f: 'K^{n+k} \rightarrow K_{n+k}^{n+k} (k \geq 2)$ be given, then the composite map $f \circ (\chi|S^{n+k})$ represents an element of $\pi_{n+k}(K_{n+k}^{n+k})$. Since $\pi_{n+k}(K_{n+k+1}^{n+k+1}) = \pi_{n+k}(K_{n+1}) = 0$ for $k \geq 2$, there is a mapping $\chi': (E^{n+k+1}, S^{n+k}) \rightarrow (K_{n+k+1}^{n+k+1}, K_{n+1}^{n+k+1})$ such that $\chi'|S^{n+k} = f \circ (\chi|S^{n+k})$. A mapping $\chi' \circ \chi^{-1}$ defines an extension of f over e^{n+k+1} . By induction we obtain a mapping

$$f_0: E(K_n) \rightarrow K_{n+1}$$

such that $f_0|S^n$ is the identical map and f_0 maps the $(n+k)$ -skeleton of $E(K_n)$ into the $(n+k)$ -skeleton of K_{n+1} .

Let $S_{n-1}(K_n)$ be a subcomplex of the singular complex $S(K_n)$ of K_n consisted of the simplexes $T^q: \Delta_q \rightarrow K_n$ such that T maps the $(n-1)$ -subsimplex of Δ_q into y_* . Define a *suspended* simplex $E'(T^q): \Delta_{q+1} \rightarrow E(K_n)$ of T^q by setting $E'(T^q)(\lambda_0, \dots, \lambda_{q+1}) = d(T(\lambda_0, \dots, \lambda_q), 2\lambda_{q+1} - 1)$ for the barycentric representative $(\lambda_0, \dots, \lambda_{q+1})$ of a point of Δ_{q+1} . Define a chain transformation $S': S_{n-1}(K_n) \rightarrow S_n(K_{n+1})$ by setting $S'(T^q) = f_0^*(E'(T^q)) - T_0^{q+1}$ where $T_0^{q+1}(\Delta_{q+1}) = y_*$, then we obtain a suspension homomorphism $S': H^q(S_{n-1}(K_n)) \rightarrow H_{q+1}(S_n(K_{n+1}))$.

Lemma (6.3) *Let $\kappa_n: K(Z, n) \rightarrow S_{n-1}(K_n) \subset S(K_n)$ be the natural chain equivalence given in [6], then we can choose a natural chain equivalence*

$\kappa_{n+1}: K(Z, n+1) \rightarrow S_n(K_{n+1})$ such that $S' \circ \kappa_n = \kappa_{n+1} \circ S$.

Therefore we have a commutative diagram

$$\begin{array}{ccc}
 H_q(K(Z, n)) & \xrightarrow{S} & H_{q+1}(K(Z, n+1)) \\
 \downarrow \kappa_n^* & \searrow S' & \downarrow \kappa_{n+1}^* \\
 H_q(K_n) & \xrightarrow{\quad} & H_{q+1}(K_{n+1}) \\
 \searrow E & & \nearrow f_0 \\
 & H_{q+1}(E(K_n)) &
 \end{array}$$

where κ_n^* , κ_{n+1}^* and E are isomorphisms.

Now we shall prove an important lemma:

Lemma (6.4) $H_{n+k+1}(K(Z, n)) \approx \pi_{n+k}(K_n^{n+k-1})/\partial[\pi_{n+k+1}(K_n^{n+k}, K_n^{n+k-1})]$ ($k \geq 1$).

In the following diagram

$$\begin{array}{ccccccc}
 & & \pi_{n+k}(K_n^{n+k}, K_n^{n+k-1}) & & & & \\
 & \nearrow \partial_3 & \nearrow i_2^* & \nearrow \partial_1 & & & \\
 \pi_{n+k+2}(K_n^{n+k+2}, K_n^{n+k+1}) & \xrightarrow{\partial_2} & \pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k}) & \xrightarrow{j_2} & \pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k+1}) & & \\
 \pi_{n+k+1}(K_n^{n+k+1}, K_n^{n+k}) & \xrightarrow{\quad} & \pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k}) & \xrightarrow{j_3} & \pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k+1}) & & \\
 & \nearrow j_1 & \nearrow \partial_0 & \nearrow \partial & & & \\
 \pi_{n+k+1}(K_n^{n+k+2}) & \xrightarrow{\quad} & \pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k-1}) & \xrightarrow{\quad} & \pi_{n+k}(K_n^{n+k-1}) & \xrightarrow{\quad} & \pi_{n+k}(K_n^{n+k+2}) \\
 & \nearrow i_1^* & \nearrow \partial & & & & \\
 & \pi_{n+k+1}(K_n^{n+k}, K_n^{n+k-1}) & & & & &
 \end{array}$$

the exactness of each direct sequences and the commutativity relations hold. By a simple algebraic lemma of T. Kudo [13, II, lemma 1], there is an isomorphism: $\text{kernel } \partial_3 / \text{kernel } i_2^* \approx \text{kernel } j_3 / \text{kernel } j_1$. Since $\pi_{n+k+1}(K_n^{n+k+2}, K_n^{n+k+1}) = 0$, $\pi_{n+k+1}(K_n^{n+k+2}) = \pi_{n+k+1}(K_n) = 0$ and $\pi_{n+k}(K_n^{n+k+1}) = \pi_{n+k}(K_n) = 0$, we have $H_{n+k+1}(K_n) = \text{kernel } \partial_3 / \text{image } \partial_2 = \text{kernel } \partial_3 / \text{kernel } i_2^* \approx \text{kernel } j_3 / \text{kernel } j_1 = \pi_{n+k+1}(K_n^{n+k}, K_n^{n+k-1}) / \text{image } i_1^* \approx \pi_{n+k}(K_n^{n+k-1}) / \text{image } \partial$, and the proof of lemma is established.

Remark that in the lemma (6.4), K_n^{n+k} is the $(n+k)$ -skeleton of K_n , but we may assume that K_n^{n+k} is an $(n+k)$ -dimensional complex such that its $(n+1)$ -skeleton is S^n and $\pi_i(K_n^{n+k}) = 0$ for $n < i < n+k$, because we can construct a complex K_n whose $(n+k)$ -skeleton is K_n^{n+k} .

For $n > 3$, we define a cell complex K_n^{n+3} as follows.

$$(6.5)_1 \quad K_n^{n+3} = S^n \cup e^{n+2} \cup e^{n+3}.$$

(6.5)₂ e^{n+2} is attached to S^n by a characteristic map $\tilde{\eta}_n: (E^{n+2}, S^{n+1}) \rightarrow (S^n \cup e^{n+2}, S^n)$ such that $\tilde{\eta}_n|S^{n+1}$ represents $\eta_n \in \pi_{n+1}(S^n)$ and $E(\tilde{\eta}_n|S^{n+1}) = \tilde{\eta}_{n+1}|S^{n+2}$, then we have $E(K_n^{n+2}) = K_{n+1}^{n+3}$ for $n \geq 2$.

(6.5)₃ e^{n+3} is attached to $S^n \cup e^{n+2} = K_n^{n+2}$ by a characteristic map $\tilde{\zeta}_n: (E^{n+3}, S^{n+2}) \rightarrow (K_n^{n+2} \cup e^{n+3}, K_n^{n+3})$ where $\tilde{\zeta}_n|S^{n+2}$ is given as follows. For $n=3$, let $\bar{2}: (E_+^5, S^4) \rightarrow (E^5, S^4)$ be a mapping of degree 2, then there is a mapping $h: E_-^5 \rightarrow S^3$ such that $h|S^4 = (\tilde{\gamma}_3 \circ \bar{2})|S^4$ for $2\eta_n = 0$. The mapping $\tilde{\zeta}_3|S^5$ is defined by setting $\tilde{\zeta}_3|E_-^5 = \tilde{\gamma}_3 \circ \bar{2}$ and $\tilde{\zeta}_3|E_+^5 = h$. For $n > 3$, $\tilde{\zeta}_n|S^{n+2}$ is defined by setting $\tilde{\zeta}_n|S^{n+2}$

$=E(\tilde{\zeta}_{n-1}|S^{n+1})$ inductively, then $E(K_n^{n+3})=K_{n+1}^{n+4}$. It is easily verified that a generator $\tilde{\zeta}_n$ of $\pi_{n+2}(K_n^{n+2})$ is represented by $\zeta_n|S^{n+2}$ for $n \geq 3$, and that

$$(6.6) \quad \pi_{n+1}(K_n^{n+2}) = 0 \quad \text{and} \quad \pi_{n+2}(K_n^{n+3}) = 0 \quad \text{for } n \geq 3.$$

By (5.9), $(\tilde{\zeta}_n|S^{n+2}) \circ \gamma_{n+2}$ is homotopic to a representative ζ of $\{\gamma_n, 2\gamma_{n+1}, \gamma_{n+1}\}$, in K_n^{n+2} and by (5.10) we have $2\zeta = \gamma_n \circ \gamma_{n+1} \circ \gamma_{n+2}$. Since a generator of the image of $\partial: \pi_{n+4}(K_n^{n+2}, S^n) \rightarrow \pi_{n+3}(S^n)$ is $\gamma_n \circ \gamma_{n+1} \circ \gamma_{n+2}$, and a generator of the image of $\partial: \pi_{n+4}(K_n^{n+3}, K_n^{n+2}) \rightarrow \pi_{n+3}(K_n^{n+2})$ is ζ , and since they are not trivial, we obtain

(6.7) *The boundary homomorphisms $\partial: \pi_{n+4}(K_n^{n+3}, K_n^{n+2}) \rightarrow \pi_{n+3}(K_n^{n+2})$ and $\partial: \pi_{n+4}(K_n^{n+2}, S^n) \rightarrow \pi_{n+3}(S^n)$ are isomorphisms into for $n \geq 3$.*

Chapter 7. The group $\pi_{n+3}(S^n)$.

Applying the lemma (6.4) to the complex K_n^{n+3} of (6.5), we have from

$$(6.1) \quad Z_2 + Z_3 \approx \pi_{n+4}(K_n^{n+2}) / \partial(\pi_{n+4}(K_n^{n+3}, K_n^{n+2})) \quad \text{for } n \geq 5.$$

By (6.7), $\partial: \pi_{n+4}(K_n^{n+3}, K_n^{n+2}) \rightarrow \pi_{n+3}(K_n^{n+2})$ is isomorphic and $\pi_{n+3}(K_n^{n+2})$ must have 12 elements. In the exact sequence $\pi_{n+4}(K_n^{n+2}, S^n) \xrightarrow{\partial} \pi_{n+3}(S^n) \xrightarrow{i^*} \pi_{n+3}(K_n^{n+2}) \xrightarrow{j} \pi_{n+3}(K_n^{n+2}, S^n) \xrightarrow{\partial'} \pi_{n+2}(S^n)$, ∂' is isomorphism onto and hence i^* is onto, while (6.7) shows that ∂ is isomorphism into and therefore $\pi_{n+3}(S^n)$ must have 24 elements. By (4.3) $\pi_6(S^3)$ has 12 elements and by (5.10) it contains an element of order four, therefore $\pi_6(S^3)$ is cyclic group of order 12. The only element of order 2 in $\pi_6(S^3)$ is $\gamma_3 \circ \gamma_4 \circ \gamma_5$ and its Hopf invariant is trivial, then α_3 must have order 4 or 12 for $H(\alpha_3) = \gamma_6 \neq 0$. Since $\alpha_n = 2\nu_n$ for $n \geq 5$, ν_n has order 8 or 24, and we obtain.

Proposition (7.1) $\pi_6(S^3) = Z_{12}$, $\pi_7(S^4) = Z + Z_{12}$ and $\pi_{n+3}(S^n) = Z_{24}$ for $n \geq 5$.

Now we shall calculate generators of these groups.

Let M^{2n} be the complex projective space, and let $M^{2n} = S^2 \cup e^4 \cup \dots \cup e^{2n}$ be its cell decomposition as in (4.iv) with characteristic maps $\tilde{p}_{n-1}: (E^{2n}, S^{2n-1}) \rightarrow (M^{2n}, M^{2n-2})$ such that $p_{n-1} = \tilde{p}_{n-1}|S^{2n-1}$ are fibre maps with fibre S^1 . Then p_n induces isomorphisms $p_n^*: \pi_p(S^{2n+1}, S^1) \rightarrow \pi_p(M^{2n})$. Let K_2 be the limit space $\bigcup_n M^{2n}$, then $M^{2n} = K_2^{2n}$ and K_2^4 is the complex given in (6.5), and the homotopy groups of K_2 are trivial except $\pi_2(K_2) = Z$. Next we construct a complex K_3^7 whose i -th homotopy groups vanish for $3 < i < 7$. In the exact sequence: $\pi_7(K_3^5, S^3) \xrightarrow{\partial} \pi_6(S^3) \rightarrow \pi_6(K_3^5) \xrightarrow{\partial'} \pi_6(K_3^5, S) \xrightarrow{\partial'} \pi_5(S^3)$, ∂ and ∂' are isomorphisms into and $\pi_6(S^3) \approx Z_{12}$, hence $\pi_6(K_3^5) \approx Z_6$ and its generator is represented by a mapping $g: S^6 \rightarrow S^3$ which represents a generator of $\pi_6(S^3)$. Define $K_3^7 = K_3^6 \cup e^7$ with characteristic mapping $\tilde{g}: (E^7, S^6) \rightarrow (S^3 \cup e^7, S^3)$ such that $\tilde{g}|S^6 = g$, then $\pi_6(K_3) = 0$ for $3 < i < 7$, and we can construct the complex K_3 such that its 7-skeleton is K_3^6 .

Let $f_0: E(K_2) \rightarrow K_3$ be a mapping given in Chapter 6, then (6.3) and (6.2) shows that $f_0^*: H_7(E(K_2)) = Z \rightarrow H_7(K_3) = Z_3$ is onto, and therefore f_0 maps $E(e^6)$ onto e^7 with degree k , where k is prime to 3. This implies that $E\tilde{p}_2: S^6 \rightarrow K_3^5 = E(M^4)$ represents an element of degree 3 or 6 in $\pi_6(K_3^5)$. Consider a diagram

$$\begin{array}{ccccc} \pi_5(S^2) & \longrightarrow & \pi_5(K_2^4) & \xrightarrow{j} & \pi_5(K_2^4, S^2) \longrightarrow \pi_4(S^2) \\ & & \downarrow E & & \downarrow E' \\ \pi_6(S^3) & \longrightarrow & \pi_6(K_3^5) & \longrightarrow & \pi_6(K_3^5, S^3). \end{array}$$

From (3.14), $\pi_6(K_2^4, S^2)$ has direct factor isomorphic to Z , and its generator is the relative product $[\iota_2, \iota_4]_r$ for generators $\iota_2 \in \pi_2(S^2)$ and $\iota_4 \in \pi_4(K_2^4, S^2)$. Since $\pi_5(K_2^4) \approx \pi_5(S^5) = Z$, $\pi_4(S^2) = Z_2$ and $[\iota_2, \eta_2] = 0^{10)}$ there is an element γ of $\pi_5(K_2^4)$ such that $j(\gamma) = [\iota_2, \iota_4]$ and $E(\gamma)$ is an element of $\pi_6(K_3^5)$ which has order 3 or 6. By lemma (2.32) α_3 is an element of $\pi_6(S^3)$ such that $i^*(\alpha_3) = E(\gamma)$. Consequently α_3 must have order 12 and generate $\pi_6(S^3)$. By (4.3) we have that ν_n has order 24 and generates $\pi_{n+3}(S^n)$ for $n \geq 5$. We have

Theorem (7.2) i) $\pi_6(S^3) \approx Z_{12}$ and its generator is α_3 ,

ii) $\pi_7(S^4) \approx Z + Z_{12}$ and its generators are ν_4 and α_4 ,

iii) $\pi_{n+3}(S^n) \approx Z_{24}$ for $n \geq 5$ and its generator is ν_n .

And also we have relations

$$(7.3) \quad 6\nu_n = 3\alpha_n = \zeta_n \circ \eta_{n+2} \quad \text{in } K_n^{n+2}, \quad 6\nu_n \in \{\eta_n, 2\iota_{n+1}, \eta_{n+1}\} \quad \text{and} \quad 12\nu_n = 6\alpha_n = \eta_n \circ \eta_{n+1} \circ \eta_{n+2} \quad \text{for } n \geq 5.$$

Chapter 8. Calculations in higher dimensions.

i) In this chapter, our calculations are teated for sufficiently large values of n , such that the exision theorem (1.23) holds, for example we may assume $n > 10$.

Define a cell complex $K_n^{n+5} = K_n^{n+3} \cup e^{n+4} \cup e^{n+5} \cup e_1^{n+6} \cup e_2^{n+6}$ as follows.

$$(8.1)_1 \quad K_n^{n+3} = S^n \cup e^{n+2} \cup e^{n+3} \text{ is defined as in (6.5).}$$

$$(8.1)_2 \quad e^{n+4} \text{ is attaced to } S^n \subset K_n^{n+3} \text{ by a characteristic map } \tilde{\nu}_n: (E^{n+4}, S^{n+3}) \rightarrow (S^n \cup e^{n+4}, S^n) \text{ such that } \tilde{\nu}_n|_{S^{n+3}} \text{ represents the generator } \nu_n \text{ of } \pi_{n+3}(S^n).$$

$$(8.1)_3 \quad e^{n+5} \text{ is attached to } K_n^{n+4} \text{ by a characteristic may } \tilde{\xi}_n: (E^{n+5}, S^{n+4}) \rightarrow (K_n^{n+5}, K_n^{n+4}) \text{ as follows, set } \tilde{\xi}_n|_{E_+^{n+4}} = \tilde{\nu}_n \circ \tilde{6} \text{ where } E_+^{n+4} = d_{n+3}(S^{n+3} \times [1/2, 1]) \text{ and } \tilde{6}: (E_+^{n+4}, \dot{E}_+^{n+4}) \rightarrow (E^{n+4}, S^{n+3}) \text{ is a mapping of degree 6, and set } \tilde{\xi}_n|_{E_-^{n+4}} = \tilde{\zeta}_n \circ \bar{\eta}_{n+3} \text{ where } \bar{\eta}_{n+3}: (E_-^{n+4}, S^{n+3}) \rightarrow (E^{n+3}, S^{n+2}) \text{ represents generator } \partial^{-1}\eta_{n+2} \text{ of } \pi_{n+4}(E^{n+3}, S^{n+2}), \text{ then we can extend the mapping } \tilde{\xi}_n \text{ over the subset } E_+^{n+4} \text{---Int. } E_+^{n+4} \text{ into } K_n^{n+4} \text{ for } 6\nu_n = \zeta_n \circ \eta_{n+2} \text{ in } K_n^{n+2}.$$

$$(8.1)_4 \quad e_1^{n+6} \text{ is attaced to } S^n \cup e^{n+4} \subset K_n^{n+5} \text{ by a characteristic map } \tilde{\eta}_{n+4}: (E^{n+6}, S^{n+5}) \rightarrow (K_n^{n+6}, K_n^{n+5}) \text{ as follows, set } \tilde{\eta}_{n+4}|_{E_+^{n+5}} = \tilde{\nu}_n \circ \bar{\eta}_{n+4} \text{ where } \bar{\eta}_{n+4}: (E_+^{n+5}, S^{n+4}) \rightarrow (E^{n+4}, S^{n+3}) \text{ represents generator } \partial^{-1}\eta_{n+3} \text{ of } \pi_{n+5}(E^{n+4}, S^{n+3}), \text{ and extend the mapping } \tilde{\eta}_{n+4}|_{S^{n+4}}: S^{n+4} \rightarrow S^n \text{ over } E_-^{n+5} \text{ such that } \eta_{n+4}(E_-^{n+5}) \subset S^n \text{ for } \nu_n \circ \eta_{n+3} = 0.$$

10) Since $g: S^3 \times S^2 \rightarrow S^2$ in iii) of Ch. 4 has type (η_1, ι_2) , we have $[\iota_2, \eta_2] = [\eta_2, \iota_2] = 0$ by (2.26).

(8.1)₅ e_2^{n+6} is attached to $S^n \cup e^{n+2} \subset K_n^{n+5}$ by a characteristic map $\tilde{\nu}_{n+2}: (E^{n+6}, S^{n+5}) \rightarrow (K_n^{n+6}, K_n^{n+5})$ as follows, set $\tilde{\nu}_{n+2}|_{E_+^{n+5}} = \eta_n \circ \nu_{n+2}$ where $\bar{\nu}_{n+2}: (E_+^{n+5}, S^{n+4}) \rightarrow (E^{n+2}, S^{n+1})$ represents the generator $\partial^{-1}\nu_{n+1}$ of $\pi_{n+5}(E^{n+2}, S^{n+1})$, and extend the mapping $\tilde{\nu}_{n+2}|_{S^{n+4}}: S^{n+4} \rightarrow S^n$ over E_-^{n+5} such that $\tilde{\nu}_{n+2}(E_-^{n+5}) \subset S^n$ for $\eta_n \circ \nu_{n+1} = 0$.

For convenience, we shall use the following notations in the chapter: $\pi_r^t = \pi_{n+r}(K_n^{n+t})$, $\pi_r = \pi_{n+r}(S^n)$ and $C^t(r-t) = \pi_{n+r}(K_n^{n+t}, K_n^{n+t-1})$. By (1.27), $C^t(r-t)$ is isomorphic to the $(n+t)$ -dimensional chain group with coefficient group π_{r-t} for sufficiently large n .

In a diagram

subsequences $\cdots \rightarrow \pi_r^{s-1} \xrightarrow{i_r^s} \pi_r^s \xrightarrow{j_r^s} C^s(r-s) \xrightarrow{\partial_r^s} \cdots \rightarrow \pi_{s-1}^{s-1} \rightarrow \pi_{s-1}^s \rightarrow 0$ are exact, and the composite homomorphisms $C^s(r-s) \rightarrow \pi_{r-1}^{s-1} \rightarrow C^{s-1}(r-s)$ are the boundary homomorphism of the chain groups.

We already know that $\pi_3^1 = \pi_3 = Z_{24}$, $\pi_3^2 = Z_{12}$, $\pi_3^3 = Z_6$ and the injection homomorphisms: $\pi_3 \xrightarrow{i_3^2} \pi_3^2 \xrightarrow{i_3^3} \pi_3^3$ are onto,

ii) The image of ∂_4^4 is generated by $\partial\{\tilde{\nu}_n\} = \nu_n$, and ν_n is the generator of π_3 , π_3^2 and π_3^3 , hence ∂_4^4 is onto and $\pi_4^4 = 0$. The complex K_n^{n+4} has the homotopy groups $\pi_i(K_n^{n+4}) = 0$ for $n < i < n+4$ and we have from (6.4) and (6.1)

$$0 = H_{n+5}(K_n) \approx \pi_4^3 / \text{image } \partial_5^4.$$

Hence ∂_5^4 is onto and i_4^4 is trivial. The image of ∂_5^4 is generated by $\nu_n \circ \eta_{n+3} = 0$,¹¹⁾ therefore we have $\pi_4^3 = 0$. The image of ∂_5^3 is generated by $\zeta_n \circ \eta_{n+2} \circ \eta_{n+3}$ ¹²⁾ $= 6\nu_n \circ \eta_{n+3} = 0$ and hence $\pi_4^2 = 0$. The image of ∂_5^2 is generated by $\eta_n \circ \nu_{n+1} = 0$ ¹¹⁾ and hence $\pi_4 = 0$. Consequently we have

11) Cf. (4.4) and (4.5).

12) Cf. (7.3).

Proposition (8.3) $\pi_{n+4}(S^n) = 0$ for $n \geq 6$.

iii) Since $\pi_4^3 = 0$, π_4^4 is isomorphic to the kernel of ∂_4^4 . $\pi_3^3 = Z_6$, $C^4(0) = Z$ and ∂_4^4 is onto, so we have that a generator of ∂_4^4 is represented by a mapping of degree 6. Let an element ξ_n of π_4^4 be presented by $\tilde{\xi}_n|S^{n+4}$, then $j_4^4(\xi_n)$ is represented by a mapping of degree 6 and therefore $j_4^4(\xi_n)$ generates the kernel of ∂_4^4 . Consequently we have that ξ_n generates π_4^4 and ∂_5^5 is onto, hence $\pi_4^5 = 0$. Applying (6.4) and (6.1) to the complex K_n^{n+5} which has the homotopy groups $\pi_i(K_n^{n+5}) = 0$ for $n < i < n+5$, we have

$$Z_2 + Z_2 = H_{n+6}(K_n) \approx \pi_5^4 / \text{image } \partial_6^5.$$

The image of ∂_6^5 is generated by $\xi_n \circ \eta_{n+5}$. Since incidence number $[e^{n+5} : e^{n+4}] = 6$, we have $j_5^4(\xi_n \circ \eta_{n+5}) = 0$, hence there is an element ξ'_n of π_5^3 such that $i_5^4(\xi'_n) = \xi_n \circ \eta_{n+5}$. From the structure of the mapping $\tilde{\xi}_n$, we have easily that the *image* $j_5^3(\xi'_n)$ is the non-zero element of $C^3 = Z_2$, hence $\xi_n \circ \eta_{n+5} = 0$, *image* $\partial_6^5 = Z_2$ and the group π_5^4 must have form $Z_2 + Z_2 + Z_2$ or $Z_2 + Z_4$. Let $\eta' \in \pi_5^4$ be represented by, $\tilde{\eta}_{n+4}|S^{n+5}$, then $j_5^4(\eta')$ is the generator of $C^4(1) = Z_2$. If $2\eta' \neq 0$, we have $2\eta' = \xi_n \circ \eta_{n+5}$. The mapping $\tilde{\eta}_{n+4}|S^{n+5}$, however, does not cover the cell e^{n+3} , therefore we have $2\eta' = 0$ in K_n^{n+4} and $\pi_5^4 = Z_2 + Z_2 + Z_2$. Since the image of ∂_6^4 is generated by $\nu_n \circ \eta_{n+3} \circ \eta_{n+4} = 0$, we have $\pi_5^3 = Z_2 + Z_2$, j_5^3 is onto and *image* $i_5^3 = Z_2$. Let ν_1 be a generator of $C^3(3) = Z_{24}$. Since the incidence number $[e^{n+3} : e^{n+2}] = 2$, we can chose a generator ν_2 of $C^2 = Z_{24}$ such that $j_5^2 \circ \partial(\nu_1) = 2\nu_2$, hence *image* $\partial_6^3 = Z_{24}$ or Z_{12} . Since $12(\zeta_n \circ \nu_{n+2}) = \zeta_n \circ 12\nu_{n+2} = \zeta_n \circ \eta_{n+2} \circ \eta_{n+3} \circ \eta_{n+4} \stackrel{12)}{=} 6\nu_n \circ \eta_{n+3} \circ \eta_{n+4} = 0$ in K_n^{n+4} , we have *image* $\partial_6^3 = Z_{12}$ and $\pi_5^3 / Z_{12} = Z_2$. Since ∂_5^2 is trivial, j_5^2 is onto and therefore isomorphism onto. It is easily seen that a generator ν' of $\pi_5^2 = Z_{24}$ is represented by the mapping $\tilde{\nu}_{n+2}|S^{n+5}$. Since $\pi_4 = 0$, we have $C^2(4) = 0$ and

Proposition (8.4) $\pi_{n+5}(S^n) = 0$ for $n \geq 7$.

iv) The generators of $\pi_5^5 = Z_2 + Z_2$ are $i_5^5(\eta')$ and $i_5^5 \circ i_5^4 \circ i_5^3(\nu')$, and they are also the image of ∂_6^6 . Hence $\pi_5^6 = 0$ and K_n^{n+6} has the homotopy groups $\pi_i(K_n^{n+6}) = 0$ ¹³⁾ for $n < i < n+6$. From (6.4) and (6.1) we have

$$0 = H_{n+7}(K_n) = \pi_6^5 / \text{image } \partial_7^6,$$

and ∂_7^6 is onto. An analogueous consideration as in iii) and the fact $2\nu_n \circ \nu_{n+3} = 0$ show that

$$\begin{aligned} \text{image } \partial_7^6 &= Z_2 + Z_2 \text{ or } Z_2 = \{\eta' \circ \eta_{n+5}, \nu' \circ \eta_{n+5}\}, \text{ image } j_6^5 = 0, \\ \text{image } \partial_7^5 &= Z_2 = \{\xi_n \circ \eta_{n+4} \circ \eta_{n+5}\} \text{ image } j_6^4 = Z_2, \\ \text{image } \partial_7^4 &= Z_2 \text{ or } 0 = \{\nu_n \circ \nu_{n+3}\}, \text{ image } j_6^3 = Z_2, \\ \text{image } \partial_7^3 &= \text{image } j_6^2 = \text{image } \partial_7^2 = 0, \end{aligned}$$

and that there are elements $\alpha_1 \in \pi_6^4$ and $\alpha_2 \in \pi_6^3$ such that $i_6^6(\alpha_1) = \eta' \circ \eta_{n+5}$, $i_6^4(\alpha_2)$

13) Cf. (4.6).

$=\xi_n \circ \eta_{n+4} \circ \eta_{n+5}$, $j_6^4(a_1) \neq 0$ and $j_6^3(a_2) \neq 0$. Consequently we have

Proposition (8.5) $\pi_{n+6}(S^n) = 0$ or Z_2 or $Z_2 + Z_2$ for $n \geq 8$.

v) To prove the non-triviality of π_6 , we construct a complex K_n^{n+7} whose homotopy groups $\pi_i(K_n^{n+7})$ vanish for $n < i < n+7$. If we assume $\pi_6 = 0$, we can prove that the group $H_{n+6}(K_n) = \pi_7^5 / \text{image } \partial_8^7$ must contain a group of 8-element and this contradict to (6.1).

Proposition (8.6) $\pi_{n+6}(S^n) = Z_2$ or $Z_2 + Z_2$ for $n \geq 8$, and the generators of which are $\nu_n \circ \nu_{n+3}$ and an element of $\{\eta_n, \nu_{n+1}, \eta_{n+4}\}$.

For their calculations show

Proposition (8.7) If $n \geq 9$ we have $\pi_{n+7}(S^n) = Z_{15} + G$ where G is a group of 2^k elements ($3 \leq k \leq 8$).

ii) If $n \geq 10$, we have that $\pi_{n+8}(S^n)$ is a group of 2^k elements.

Appendix 1. The homotopy groups of the suspended space of the projective plane.

Let Y^2 be the real projective plane, and let $Y^2 = S^1 \cup e^2$ be its cell decomposition in which the cell e^2 is attached to S^1 by a mapping of degree 2. Let Y^{n+1} be the $(n-1)$ -fold suspended space of Y^2 , then $Y^{n+1} = S^n \cup e^{n+1}$ is also a cell complex with a characteristic mapping $\tilde{\omega}: (E^{n+1}, S^n) \rightarrow (Y^{n+1}, S^n)$ such that $\tilde{\omega}|_{S^n} = \omega$ is a mapping of degree 2. By (1.26) the characteristic mapping $\tilde{\omega}$ induces the isomorphism $\tilde{\omega}^*: \pi_p(E^{n+1}, S^n) \rightarrow \pi_p(Y^{n+1}, S^n)$ for $p \leq 2n-2$. Since the boundary homomorphism $\partial: \pi_p(E^{n+1}, S^n) \rightarrow \pi_{p-1}(S^n)$ is isomorphism, we obtain an exact sequence

$$\cdots \xrightarrow{\omega^*} \pi_p(S^n) \xrightarrow{i^*} \pi_p(Y^{n+1}) \xrightarrow{\Delta} \pi_{p-1}(S^n) \xrightarrow{\omega^*} \pi_{p-1}(S^n) \longrightarrow \cdots$$

by setting $\Delta = \partial \circ \omega^{*-1} \circ j$ for $p \leq 2n-2$. Since $E: \pi_{p-2}(S^{n-1}) \rightarrow \pi_{p-1}(S^n)$ is onto for $p \leq 2n-1$, we have $\omega^*(a) = 2a_n \circ a = 2a_n \circ E a' = 2E a' = 2a$, and therefore the kernel of ω^* is the subgroup ${}_2[\pi_{p-1}(S^n)]$ and the image of i^* is isomorphic to $\pi_p(S^n)/2\pi_p(S^n)$.

Lemma If γ is an element of $\pi_p(Y^{n+1})$ such that $\Delta(\gamma) = a \in \pi_{p-1}(S^n)$, then $2\gamma = i^*(a \circ \eta_n)$.

The lemma follows from (5.9) and (5.7). Applying this lemma to the results of $\pi_n(S^n)$ we have

Theorem

- i) $\pi_n(Y^{n+1}) = Z_2$ $n \geq 1$,
- ii) $\pi_{n+1}(Y^{n+1}) = Z_2$ $n \geq 3$,
- iii) $\pi_{n+2}(Y^{n+1}) = Z_4$ $n \geq 4$,
- iv) $\pi_{n+3}(Y^{n+1}) = Z_2 + Z_2$ $n \geq 5$,
- v) $\pi_{n+4}(Y^{n+1}) = Z_2$ $n \geq 6$,
- vi) $\pi_{n+5}(Y^{n+1}) = 0$ $n \geq 7$,
- vii) $\pi_{n+6}(Y^{n+1}) = Z_2$ or $Z_2 + Z_2$ $n \geq 8$.

Appendix 2. Lower dimensional cases

Recently P. Sree, [16] has provided that there is a homomorphism: $\pi_{n-2}(S^{2r-3}) \rightarrow \pi_n(S^r; E_+^r, E_-^r)$ and which is onto for $n \leq 3r-4$ and isomorphic for $n < 3r-4$. By (3.13) $\pi_n(S^r; E_+^r, E_-^r)$ has a direct factor isomorphic to $\pi_{n+1}(S^{2r})$ for $n \leq 3r-4$. Therefore the homomorphism $P: \pi_{n-r+1}(E_-^r, S^{r-1}) \rightarrow \pi_n(S^r; E_+^r, E_-^r)$ given by $P(u)=[u, \iota_r]_t$ is isomorphism onto for $n \leq 3r-4$, where ι_r is a generator of $\pi_r(E_+^r, S^{r-1})$. The exactness of the sequence $\pi_{n+2}(S^{r+1}; E_+^{r+1}, E_-^{r+1}) \xrightarrow{\Delta} \pi_n(S^r) \xrightarrow{E} \pi_{n+1}(S^{r+1})$ shows that the kernel of suspension homomorphism $E: \pi_n(S^r) \rightarrow \pi_{n+1}(S^{r+1})$ is generated by the Whitehead product $[u, \iota_r]$ ($u \in \pi_{n-r+1}(S^r)$) for $n \leq 3r-3$.

The following list of special Whitehead product is verified ($n \leq 3r-3$)

n	8	9	9	10	11	11	12	13
r	4	5	4	5	6	5	6	7
	$[\eta_4, \iota_4] \neq 0$	$[\iota_5, \iota_5] \neq 0$	$[\eta_7 \circ \eta_5, \iota_4] \neq 0$	$[\eta_5, \iota_5] \neq 0$	$[\iota_6, \iota_6] \neq 0$	$[\eta_5 \circ \eta_6, \iota_5] \neq 0$	$[\eta_6, \iota_6] \neq 0$	$[\iota_7, \iota_7] \neq 0$

$[\eta_6, \iota_6] = 0$ and $[\iota_7, \iota_7] = 0$ follow from (2.26) and the fact that there are mappings of types (η_6, ι_6) and (ι_7, ι_7) . By (7.3), (2.23) and (4.6) we have $[\eta_5 \circ \eta_6, \iota_5] = \nu_5 \circ \eta_8 \circ \eta_9 \circ \eta_{10} = \nu_5 \circ 12\nu_8 = 12\nu_5 \circ \nu_8 = 0$. Since $H[\iota_6, \iota_6] = 2\iota_{12} \neq 0$ we have $[\iota_6, \iota_6] \neq 0$. The fact $[\eta_4, \iota_4] = \alpha_4 \circ \eta_7 \neq 0$ and $[\iota_5, \iota_5] = \nu_5 \circ \eta_8 \neq 0$ is already verified in (4.4) and (4.5). From (2.23) we have $[\eta_4 \circ \eta_5, \iota_4] = \alpha_4 \circ \eta_7 \circ \eta_8$ and $[\eta_5, \iota_5] = \nu_5 \circ \eta_8 \circ \eta_7$. Since $H(\alpha_3 \circ \eta_6 \circ \eta_7) = \eta_6 \circ \eta_7 \circ \eta_8 \neq 0$ and $H(\nu_4 \circ \eta_7 \circ \eta_8) = \eta_8 \circ \eta_9 \neq 0$, we have by (4.2)' $E(\alpha_3 \circ \eta_6 \circ \eta_7) \neq 0$ and $E(\nu_4 \circ \eta_7 \circ \eta_8) \neq 0$.

Therefore the exactness of the sequence $\cdots \pi_{n+1}(S^r) \xrightarrow{E} \pi_{n+2}(S^{r+1}) \xrightarrow{I} \pi_{n+2}(S^{r+1}; E_+^{r+1}, E_-^{r+1}) \xrightarrow{\Delta} \pi_n(S^r) \xrightarrow{E} \pi_{n+1}(S^{r+1}) \rightarrow \cdots$ leads the following results;

- i) $E: \pi_8(S^4) \rightarrow \pi_9(S^5)$ is onto and its kernel is generated by $\eta_4 \circ \nu_5$,
- ii) $E: \pi_9(S^5) \rightarrow \pi_{10}(S^6)$ is onto and its kernel is generated by $\nu_5 \circ \eta_8$,
- iii) $E: \pi_{10}(S^6) \rightarrow \pi_{11}(S^7)$ is onto its kernel is generated by $\eta_4 \circ \nu_5 \circ \eta_8$,
- iv) $E: \pi_{10}(S^5) \rightarrow \pi_{11}(S^6)$ maps into the subgroup of $\pi_{11}(S^6)$ which is generated by the elements of the Hopf invariants 0, and the kernel of E is generated by $\nu_5 \circ \eta_8 \circ \eta_9$.
- v) $E: \pi_{11}(S^6) \rightarrow \pi_{12}(S^7)$ is onto and its kernel is generated by $[\iota_6, \iota_6]$,
- vi) $E: \pi_{11}(S^5) \rightarrow \pi_{12}(S^6)$ is isomorphism onto,
- vii) $E: \pi_{12}(S^6) \rightarrow \pi_{13}(S^7)$ is isomorphism onto,
- viii) $E: \pi_{13}(S^7) \rightarrow \pi_{14}(S^8)$ is isomorphism onto.

Summarizing the results of $\pi_n(S^r)$ we obtain;

- a) $\pi_n(S^n) = Z$ for $n \geq 1$, $\pi_n(S^1) = 0$ for $n > 1$ and $\pi_n(S^r) = 0$ for $n < r$.
- b) $\pi_3(S^2) = Z = \{\eta_2\}$ and $\pi_{n+1}(S^n) = Z_2 = \{\eta_n\}$ for $n \geq 3$,

- c) $\pi_{n+2}(S^n) = Z_2 = \{\eta_n \circ \eta_{n+1}\}$ for $n \geq 2$,
d) $\pi_5(S^2) = Z_2 = \{\eta_2 \circ \eta_3 \circ \eta_4\}$, $\pi_6(S^3) = Z_{12} = \{\alpha_3\}$, $\pi_7(S^4) = Z + Z_{12} = \{\nu_4\} + \{\alpha_4\}$ and $\pi_{n+3}(S^n) = Z_{24} = \{\nu_n\}$ for $n \geq 5$,
e) $\pi_6(S^2) = Z_2 = \{\eta_2 \circ \alpha_3\}$, $\pi_7(S^3) = Z_2 = \{\eta_3 \circ \nu_4\}$, $\pi_8(S^4) = Z_2 + Z_2 = \{\eta_4 \circ \nu_5\} + \{\nu_4 \circ \eta_7\}$, $\pi_9(S^5) = Z_2 = \{\nu_5 \circ \eta_8\}$ and $\pi_{n+4}(S^n) =$ for $n \geq 6$.
f) $\pi_7(S^2) = Z_2 = \{\eta_2 \circ \eta_3 \circ \nu_4\}$, $\pi_8(S^3) = Z_2 = \{\eta_3 \circ \nu_4 \circ \eta_7\}$, $\pi_9(S^4) = Z_2 + Z_2 = \{\eta_4 \circ \nu_5 \circ \eta_8\} + \{\nu_4 \circ \eta_7 \circ \eta_8\}$, $\pi_{10}(S^5) = Z_2 = \{\nu_5 \circ \eta_8 \circ \eta_9\}$, $\pi_{11}(S^6) = Z = [\iota_6, \iota_6]$ and $\pi_{n+5}(S^n) = 0$ for $n \geq 7$.
g) $\pi_{n+6}(S^n) = Z_2 = \{\nu_n \circ \nu_{n+3}\}$ or $= Z_2 + Z_2 = \{\nu_n \circ \nu_{n+3}\} + \{\eta_n, \nu_{n+1}, \eta_{n+4}\}$ for $n \geq 5$.
The essentiality of $\nu_n \circ \nu_{n+3}$ is follows from (4.2).
